

Lecture 20: Generative Models, Part 2

Assignment 5: Object Detection

Single-stage detector

Two-stage detector

Due on Monday 12/9, 11:59pm

Assignment 6: Generative Models

Generative Adversarial Networks

Variational Autoencoders (maybe)

Will be released today or tomorrow

Due two weeks after release

Shorter than A5!

Last Time: Supervised vs Unsupervised Learning

Supervised Learning

Data: (x, y)

x is data, y is label

Goal: Learn a *function* to map $x \rightarrow y$

Examples: Classification, regression,
object detection, semantic
segmentation, image captioning, etc.

Unsupervised Learning

Data: x

Just data, no labels!

Goal: Learn some underlying
hidden *structure* of the data

Examples: Clustering,
dimensionality reduction, feature
learning, density estimation, etc.

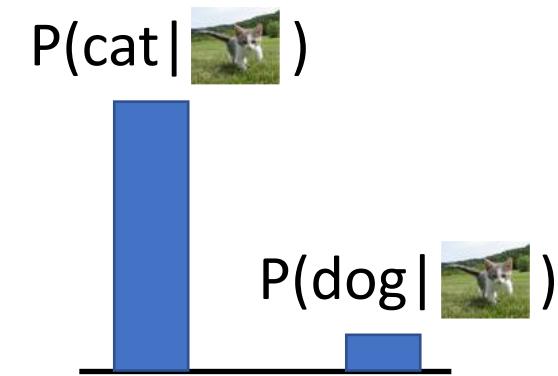

Last Time: Discriminative vs Generative Models

Discriminative Model:
Learn a probability distribution $p(y|x)$

Generative Model:
Learn a probability distribution $p(x)$

Conditional Generative Model: Learn $p(x|y)$

Data: x

Density Function

$p(x)$ assigns a positive number to each possible x ; higher numbers mean x is more likely

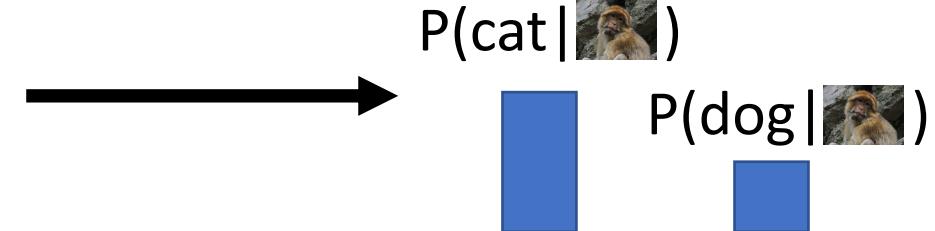

Density functions are **normalized**:

$$\int_X p(x)dx = 1$$

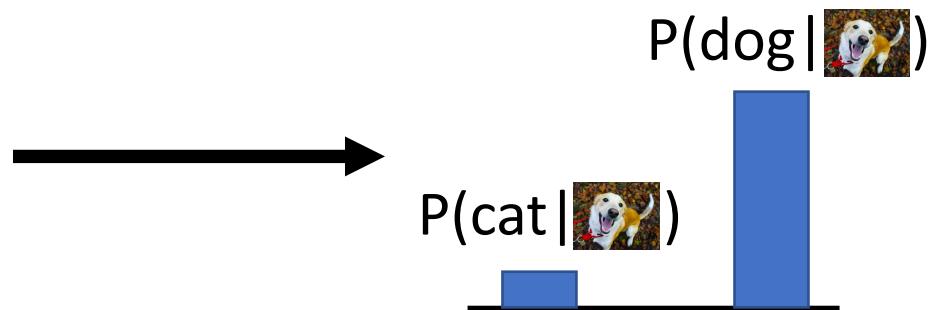

Different values of x compete for density

Last Time: Discriminative vs Generative Models

Discriminative Model:
Learn a probability distribution $p(y|x)$

Generative Model:
Learn a probability distribution $p(x)$

Conditional Generative Model: Learn $p(x|y)$

Discriminative model: No way for the model to handle unreasonable inputs; it must give label distributions for all images

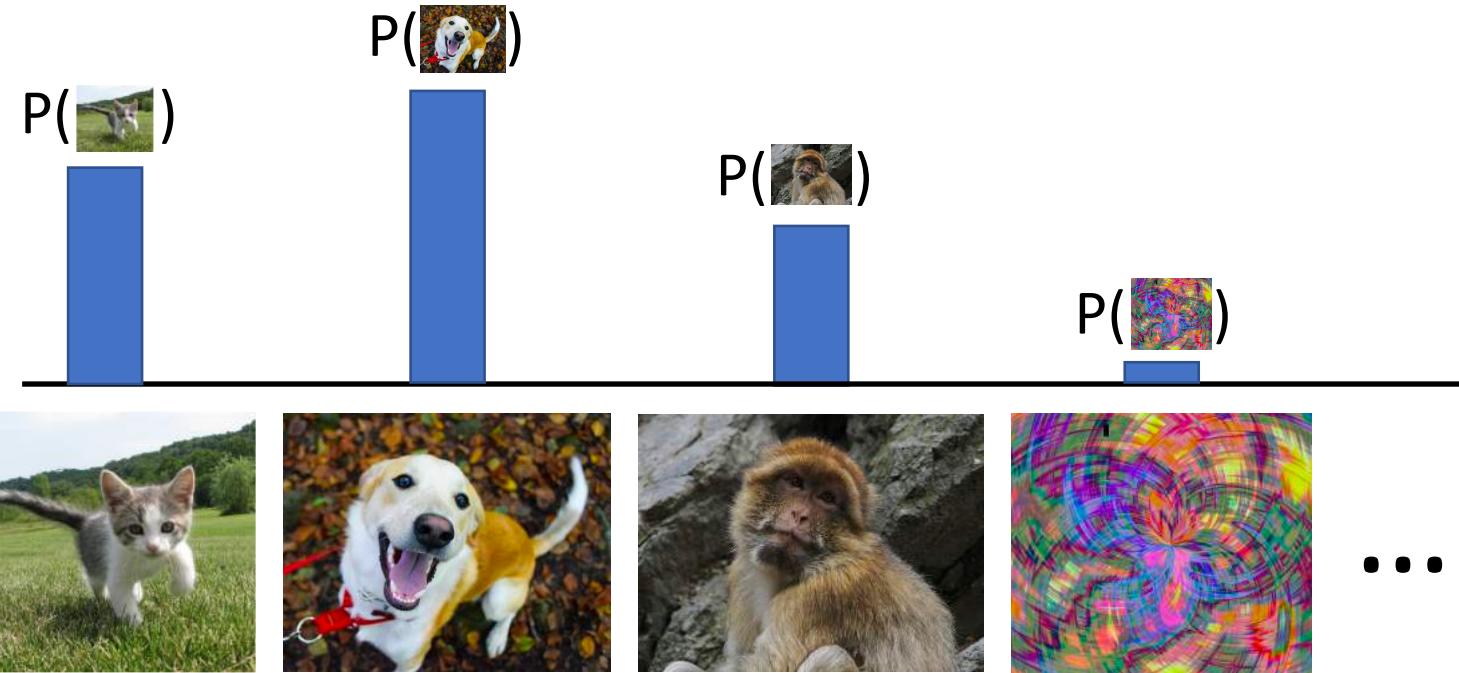

[Monkey image](#) is CC0 Public Domain

Last Time: Discriminative vs Generative Models

Discriminative Model:
Learn a probability distribution $p(y|x)$

Generative Model:
Learn a probability distribution $p(x)$

Conditional Generative Model: Learn $p(x|y)$

Generative model: All possible images compete with each other for probability mass

Requires deep image understanding! Is a dog more likely to sit or stand? How about 3-legged dog vs 3-armed monkey?

Last Time: Discriminative vs Generative Models

Discriminative Model:

Learn a probability distribution $p(y|x)$

Generative Model:

Learn a probability distribution $p(x)$

Conditional Generative Model: Learn $p(x|y)$

Recall Bayes' Rule:

$$P(x | y) = \frac{P(y | x)}{P(y)} P(x)$$

Conditional Generative Model Discriminative Model (Unconditional) Generative Model

Prior over labels

We can build a conditional generative model from other components!

Last Time: Taxonomy of Generative Models

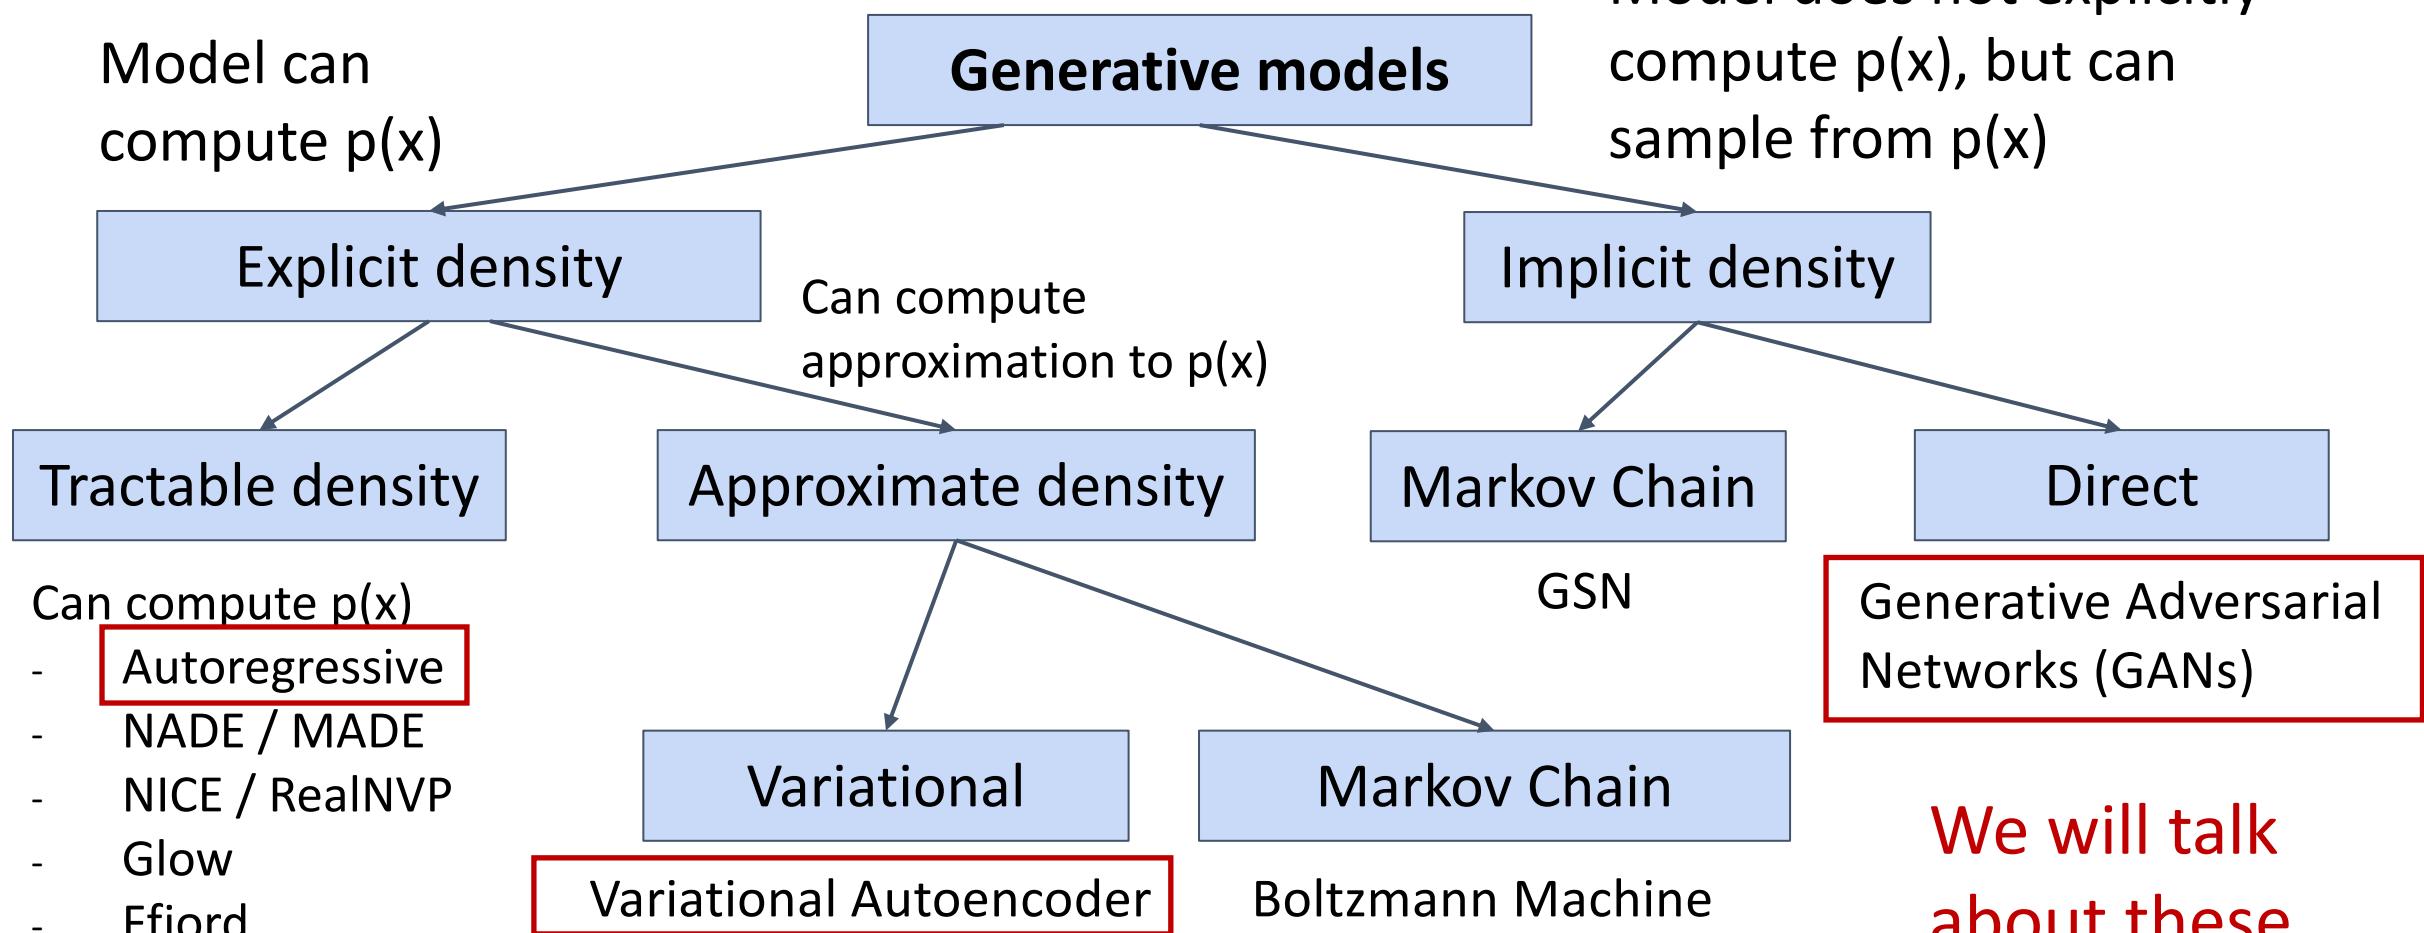

Figure adapted from Ian Goodfellow, Tutorial on Generative Adversarial Networks, 2017.

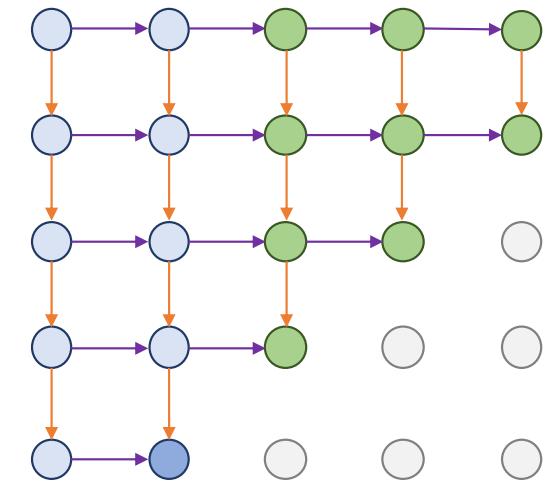

Last Time: Autoregressive Models

Explicit Density Function

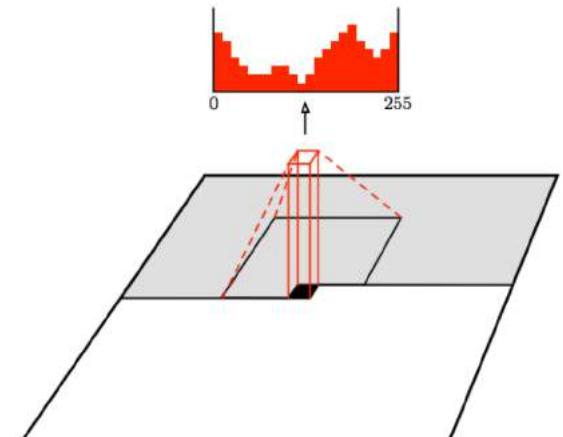

$$\begin{aligned} p(x) &= p(x_1, x_2, x_3, \dots, x_T) \\ &= p(x_1)p(x_2 | x_1)p(x_3 | x_1, x_2) \dots \\ &= \prod_{t=1}^T p(x_t | x_1, \dots, x_{t-1}) \end{aligned}$$

Train by maximizing
log-likelihood of
training data

PixelRNN

PixelCNN

Van den Oord et al, "Pixel Recurrent Neural Networks", ICML 2016

Van den Oord et al, "Conditional Image Generation with PixelCNN Decoders", NeurIPS 2016

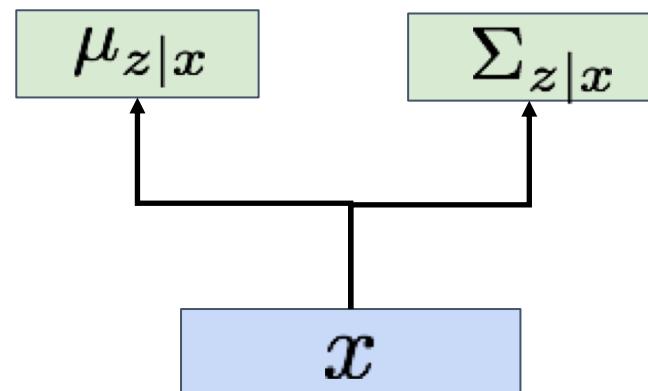

Last Time: Variational Autoencoders

Jointly train **encoder** q and **decoder** p to maximize the **variational lower bound** on the data likelihood

$$\log p_\theta(x) \geq E_{z \sim q_\phi(z|x)} [\log p_\theta(x|z)] - D_{KL} (q_\phi(z|x), p(z))$$

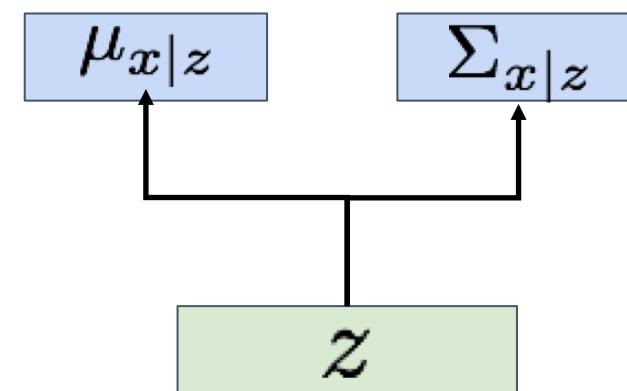

Encoder Network

$$q_\phi(z | x) = N(\mu_{z|x}, \Sigma_{z|x})$$

Decoder Network

$$p_\theta(x | z) = N(\mu_{x|z}, \Sigma_{x|z})$$

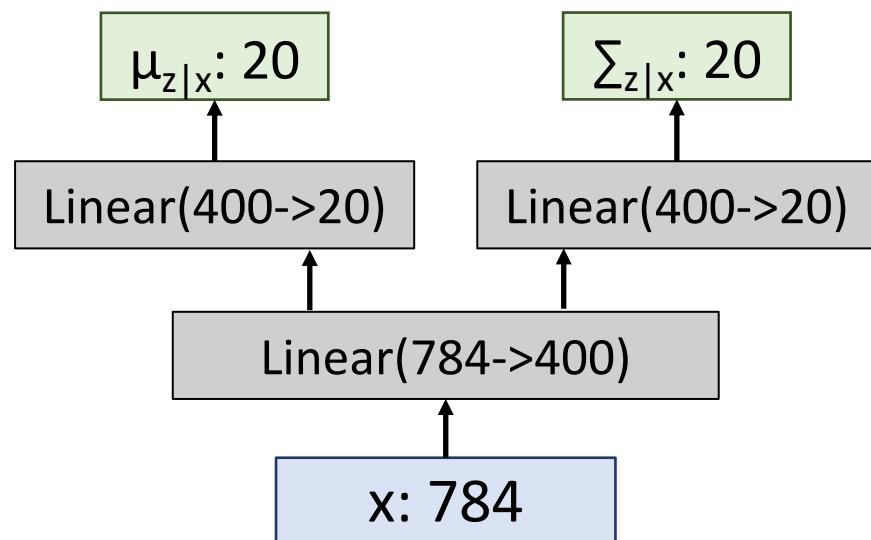

Example: Fully-Connected VAE

x : 28x28 image, flattened to 784-dim vector

z : 20-dim vector

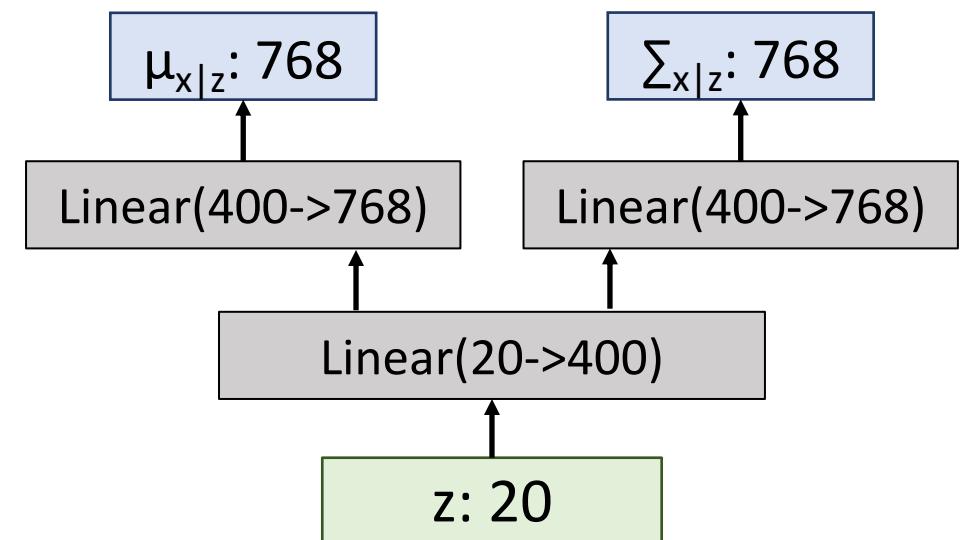

Encoder Network

$$q_{\phi}(z | x) = N(\mu_{z|x}, \Sigma_{z|x})$$

Decoder Network

$$p_{\theta}(x | z) = N(\mu_{x|z}, \Sigma_{x|z})$$

Variational Autoencoders

Train by maximizing the
variational lower bound

$$E_{z \sim q_\phi(z|x)} [\log p_\theta(x|z)] - D_{KL} (q_\phi(z|x), p(z))$$

Input
Data

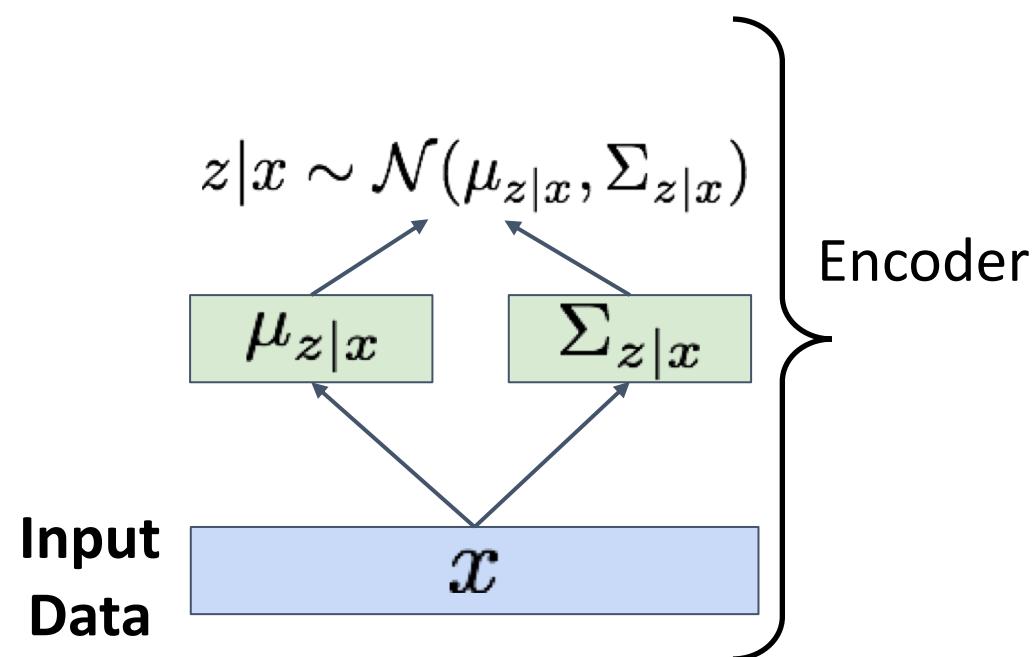

x

Variational Autoencoders

Train by maximizing the
variational lower bound

$$E_{z \sim q_\phi(z|x)} [\log p_\theta(x|z)] - D_{KL} (q_\phi(z|x), p(z))$$

1. Run input data through **encoder** to get a distribution over latent codes

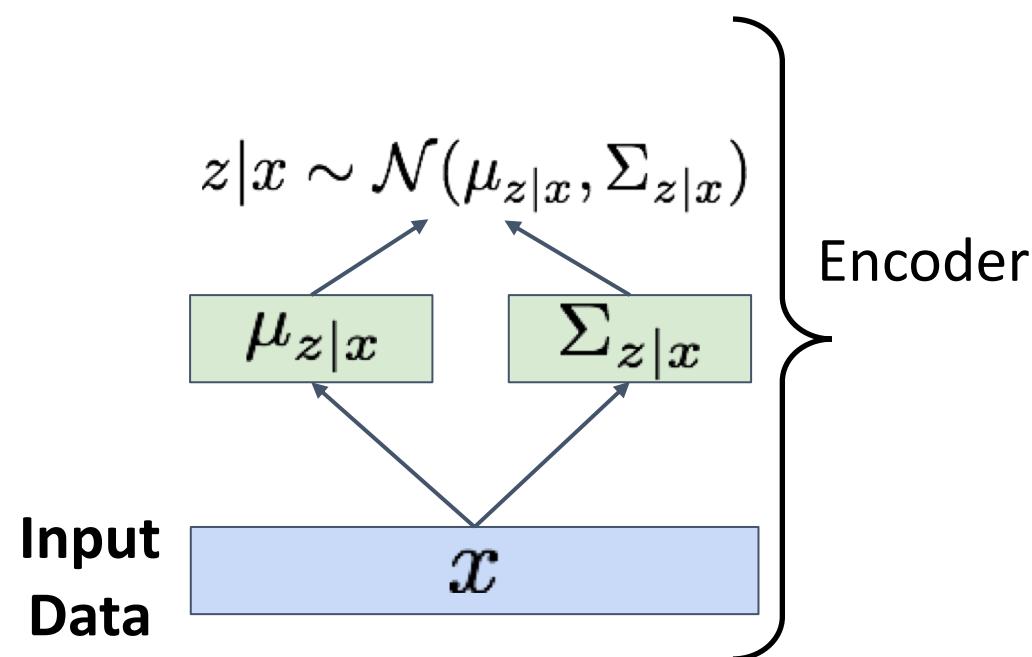

Variational Autoencoders

Train by maximizing the
variational lower bound

$$E_{z \sim q_\phi(z|x)} [\log p_\theta(x|z)] - D_{KL} (q_\phi(z|x), p(z))$$

1. Run input data through **encoder** to get a distribution over latent codes
2. **Encoder output should match the prior $p(z)$!**

Variational Autoencoders

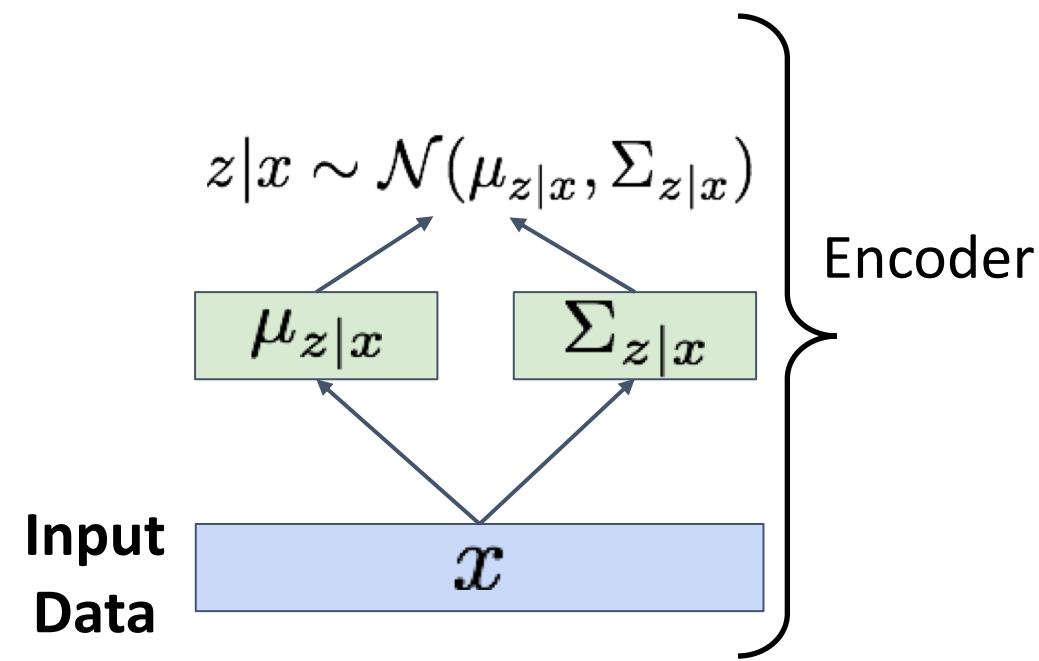

Train by maximizing the
variational lower bound

$$E_{z \sim q_\phi(z|x)} [\log p_\theta(x|z)] - D_{KL} (q_\phi(z|x), p(z))$$

1. Run input data through **encoder** to get a distribution over latent codes
2. **Encoder output should match the prior $p(z)$!**

$$\begin{aligned} -D_{KL} (q_\phi(z|x), p(z)) &= \int_Z q_\phi(z|x) \log \frac{p(z)}{q_\phi(z|x)} dz \\ &= \int_Z N(z; \mu_{z|x}, \Sigma_{z|x}) \log \frac{N(z; 0, I)}{N(z; \mu_{z|x}, \Sigma_{z|x})} dz \\ &= \sum_{j=1}^J \left(1 + \log \left((\Sigma_{z|x})_j^2 \right) - (\mu_{z|x})_j^2 - (\Sigma_{z|x})_j^2 \right) \end{aligned}$$

Closed form solution when
 q_ϕ is diagonal Gaussian and
 p is unit Gaussian!
(Assume z has dimension J)

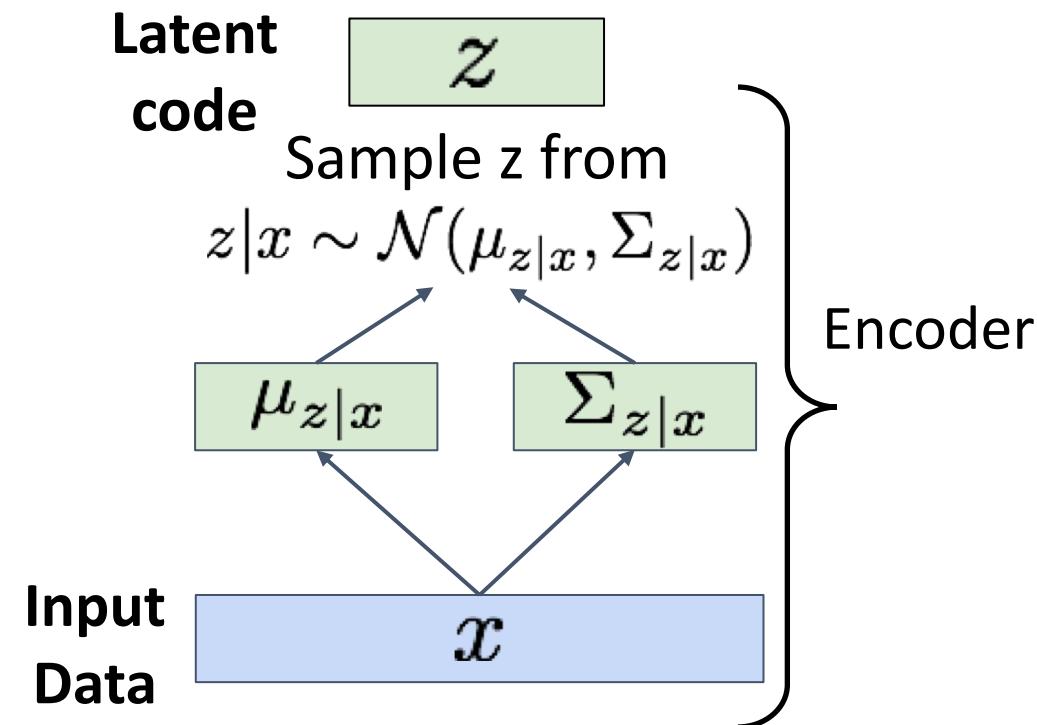

Variational Autoencoders

Train by maximizing the
variational lower bound

$$E_{z \sim q_\phi(z|x)}[\log p_\theta(x|z)] - D_{KL}(q_\phi(z|x), p(z))$$

1. Run input data through **encoder** to get a distribution over latent codes
2. **Encoder output should match the prior $p(z)$!**
3. Sample code z from encoder output

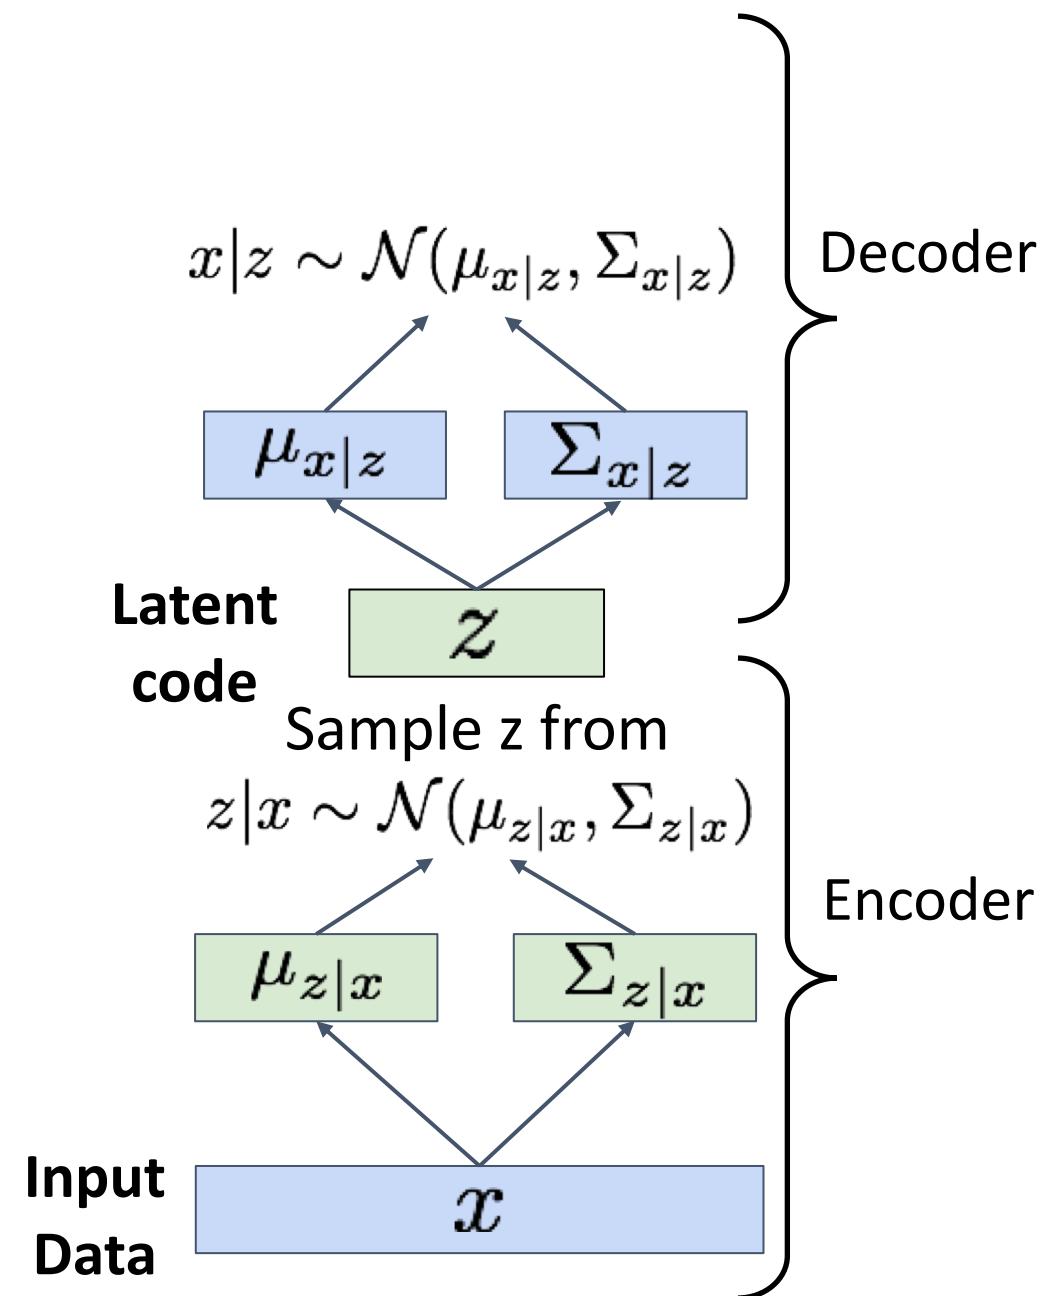

Variational Autoencoders

Train by maximizing the
variational lower bound

$$E_{z \sim q_\phi(z|x)}[\log p_\theta(x|z)] - D_{KL}(q_\phi(z|x), p(z))$$

1. Run input data through **encoder** to get a distribution over latent codes
2. **Encoder output should match the prior $p(z)$!**
3. Sample code z from encoder output
4. Run sampled code through **decoder** to get a distribution over data samples

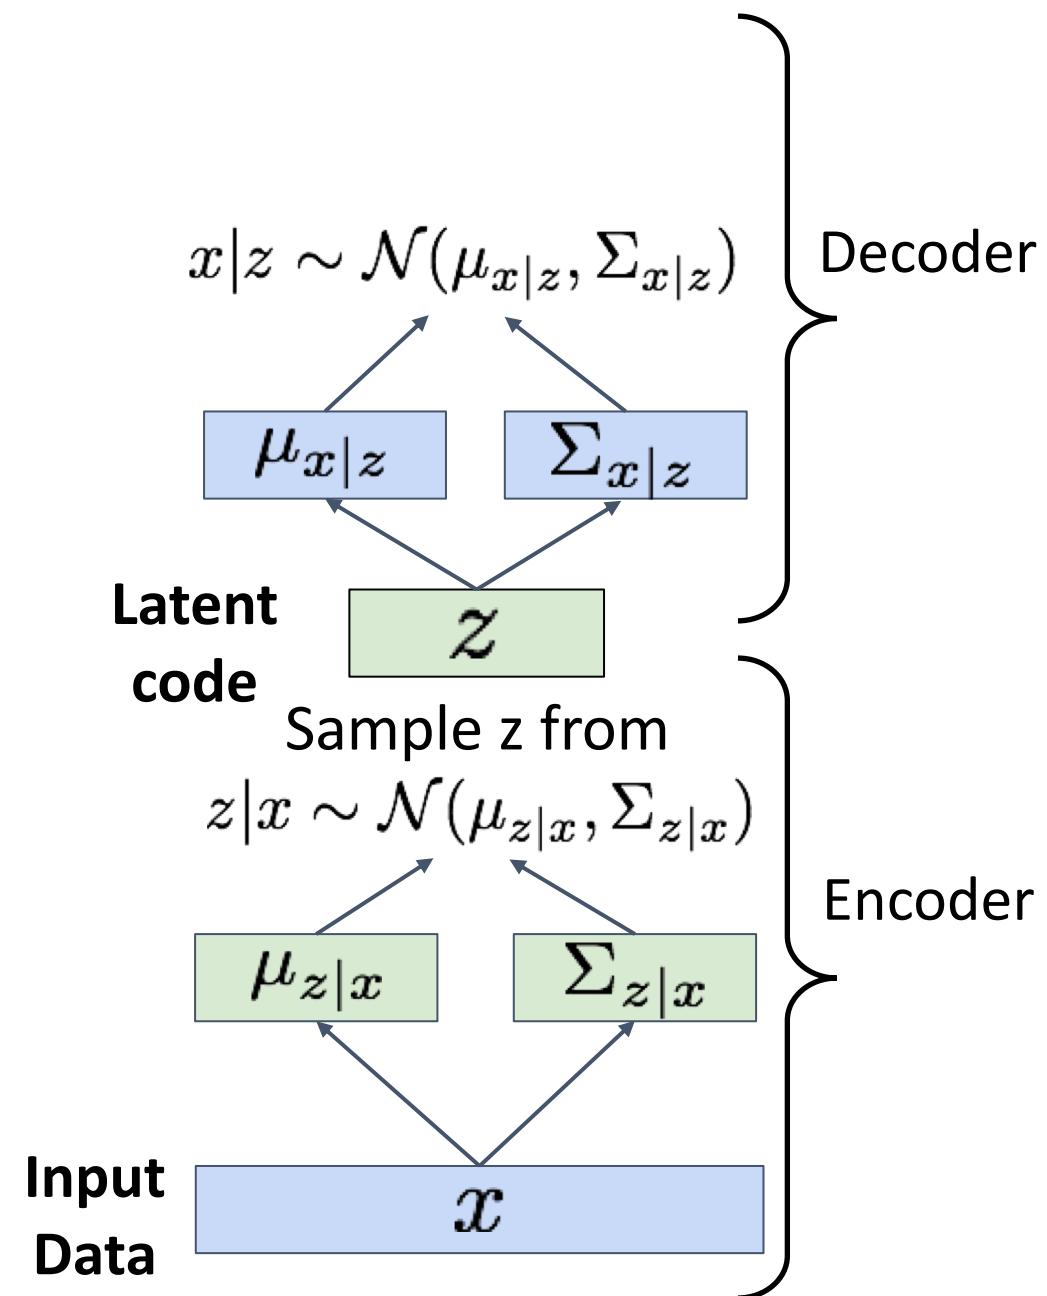

Variational Autoencoders

Train by maximizing the
variational lower bound

$$E_{z \sim q_\phi(z|x)}[\log p_\theta(x|z)] - D_{KL}(q_\phi(z|x), p(z))$$

1. Run input data through **encoder** to get a distribution over latent codes
2. **Encoder output should match the prior $p(z)$!**
3. Sample code z from encoder output
4. Run sampled code through **decoder** to get a distribution over data samples
5. **Original input data should be likely under the distribution output from (4)!**

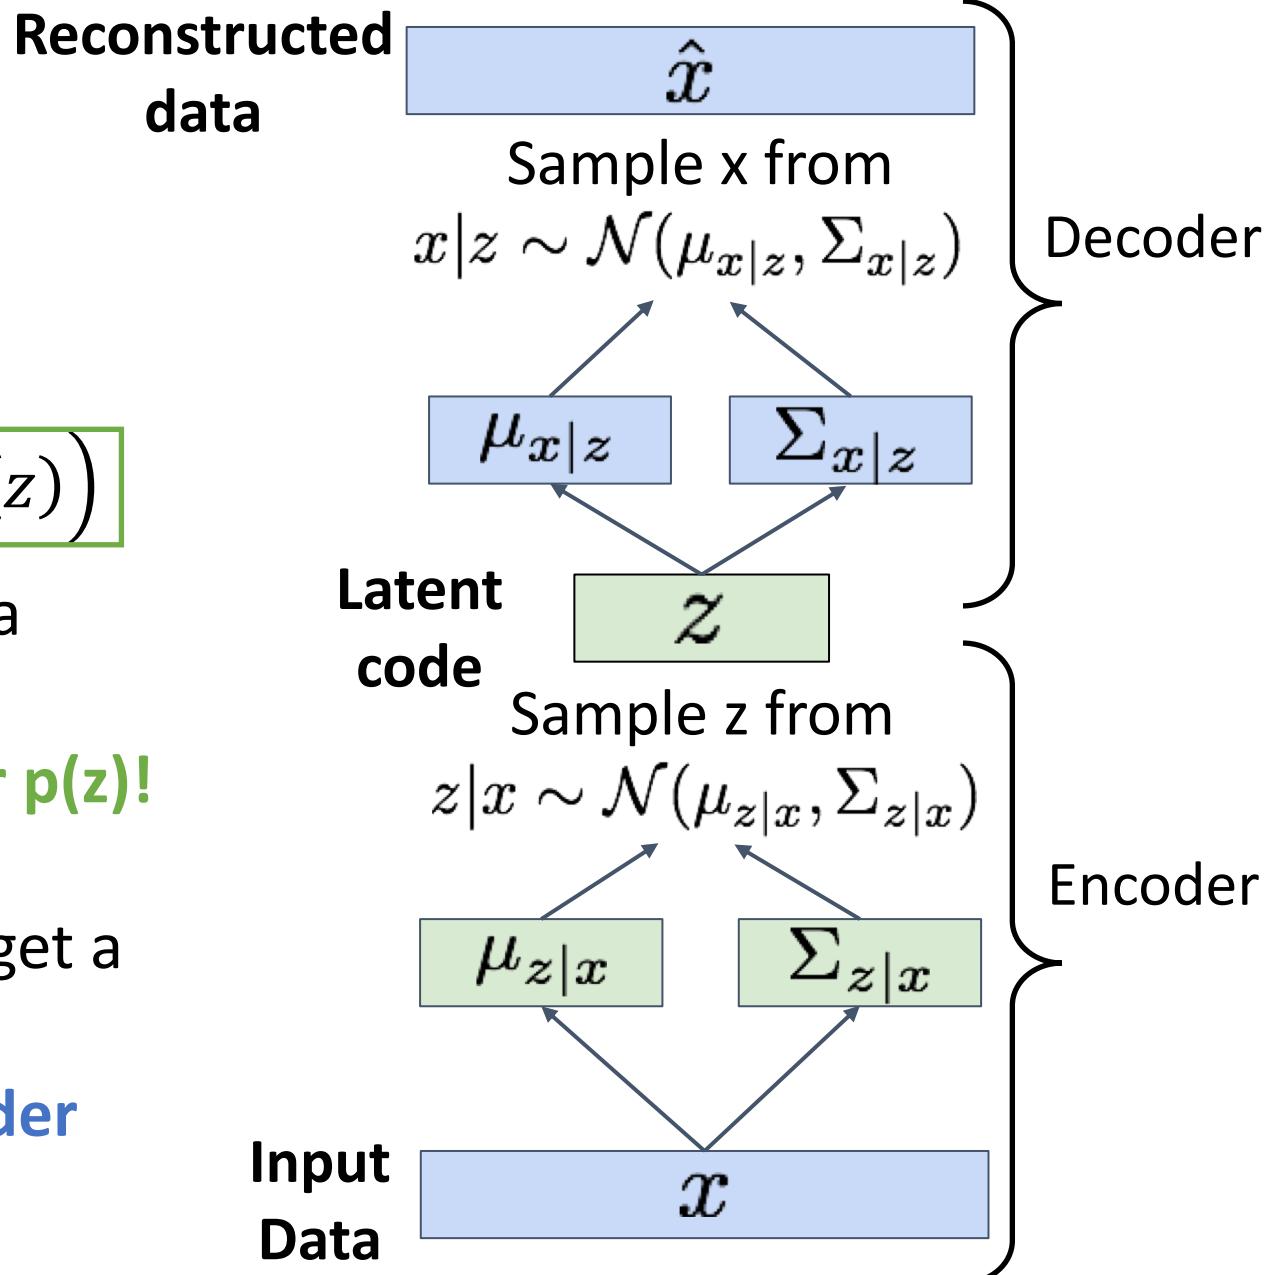

Variational Autoencoders

Train by maximizing the
variational lower bound

$$E_{z \sim q_\phi(z|x)}[\log p_\theta(x|z)] - D_{KL}(q_\phi(z|x), p(z))$$

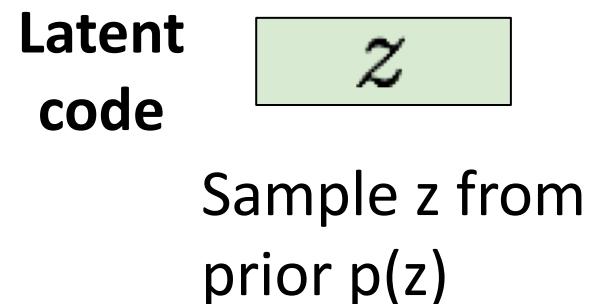

1. Run input data through **encoder** to get a distribution over latent codes
2. **Encoder output should match the prior $p(z)$!**
3. Sample code z from encoder output
4. Run sampled code through **decoder** to get a distribution over data samples
5. **Original input data should be likely under the distribution output from (4)!**
6. Can sample a reconstruction from (4)

Variational Autoencoders: Generating Data

After training we can
generate new data!

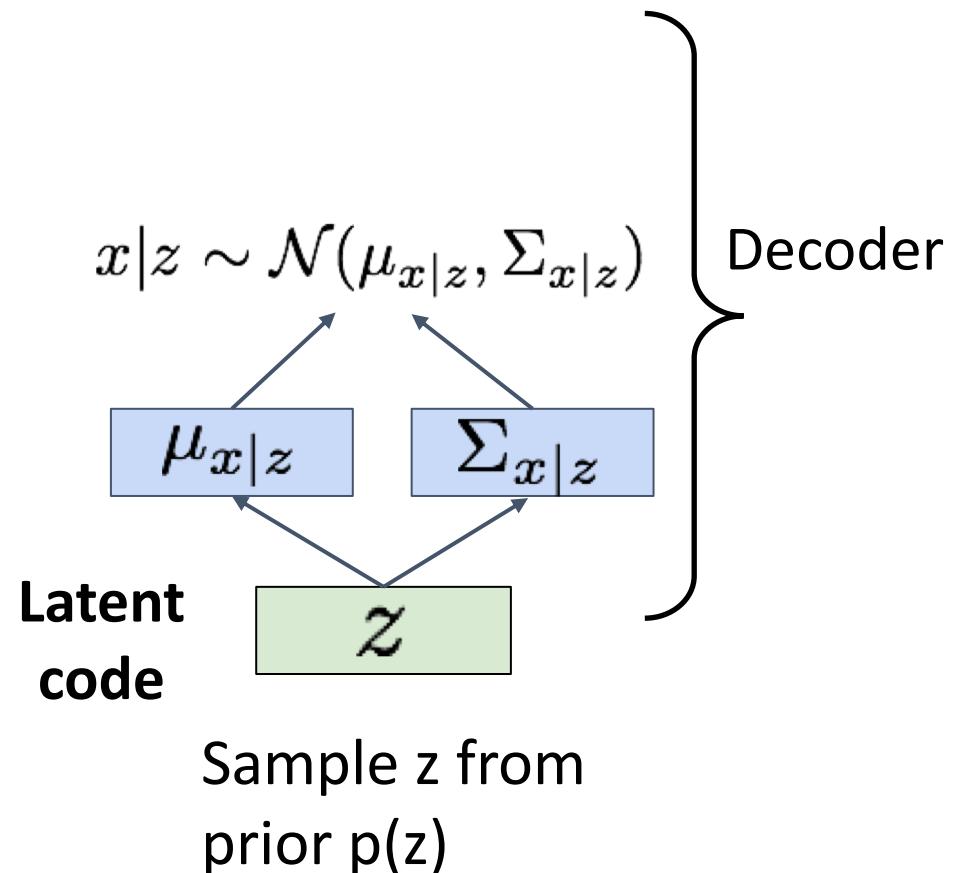

1. Sample z from prior $p(z)$

Variational Autoencoders: Generating Data

After training we can generate new data!

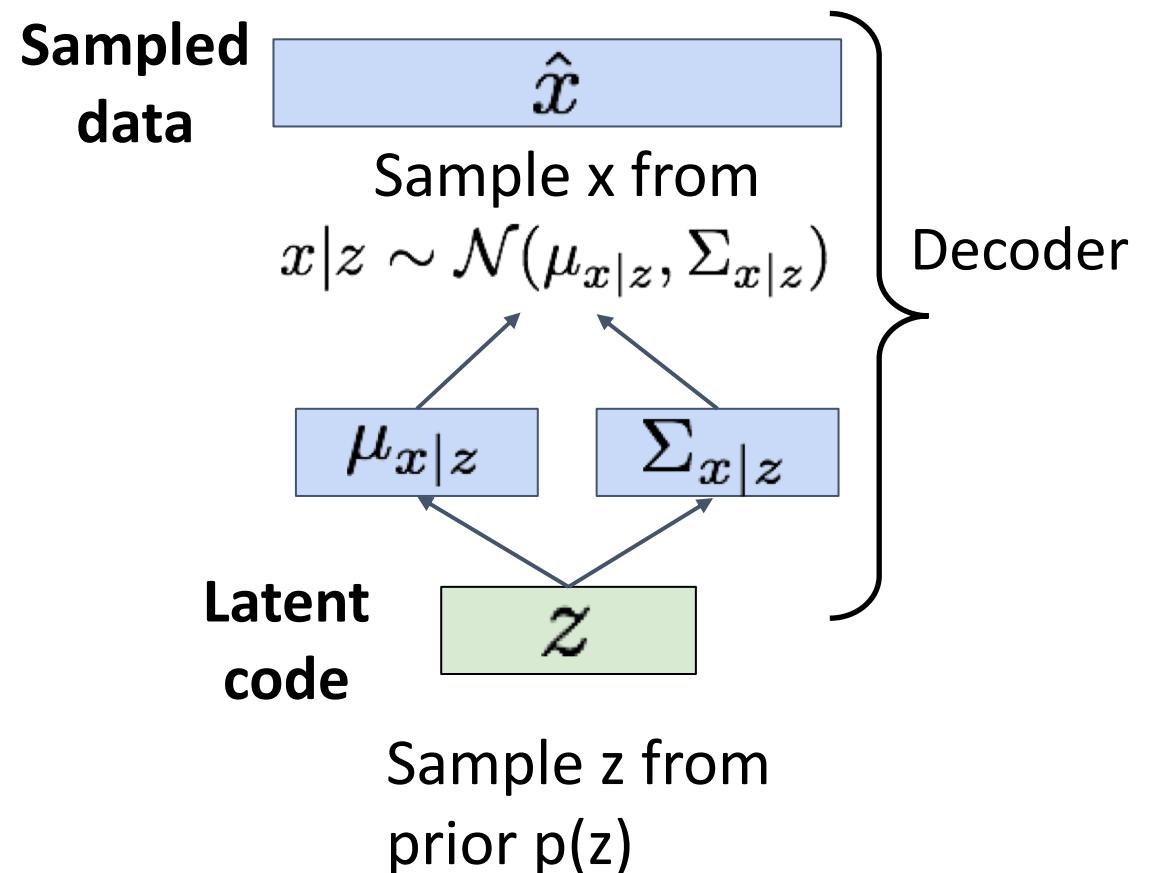

1. Sample z from prior $p(z)$
2. Run sampled z through decoder to get distribution over data x

Variational Autoencoders: Generating Data

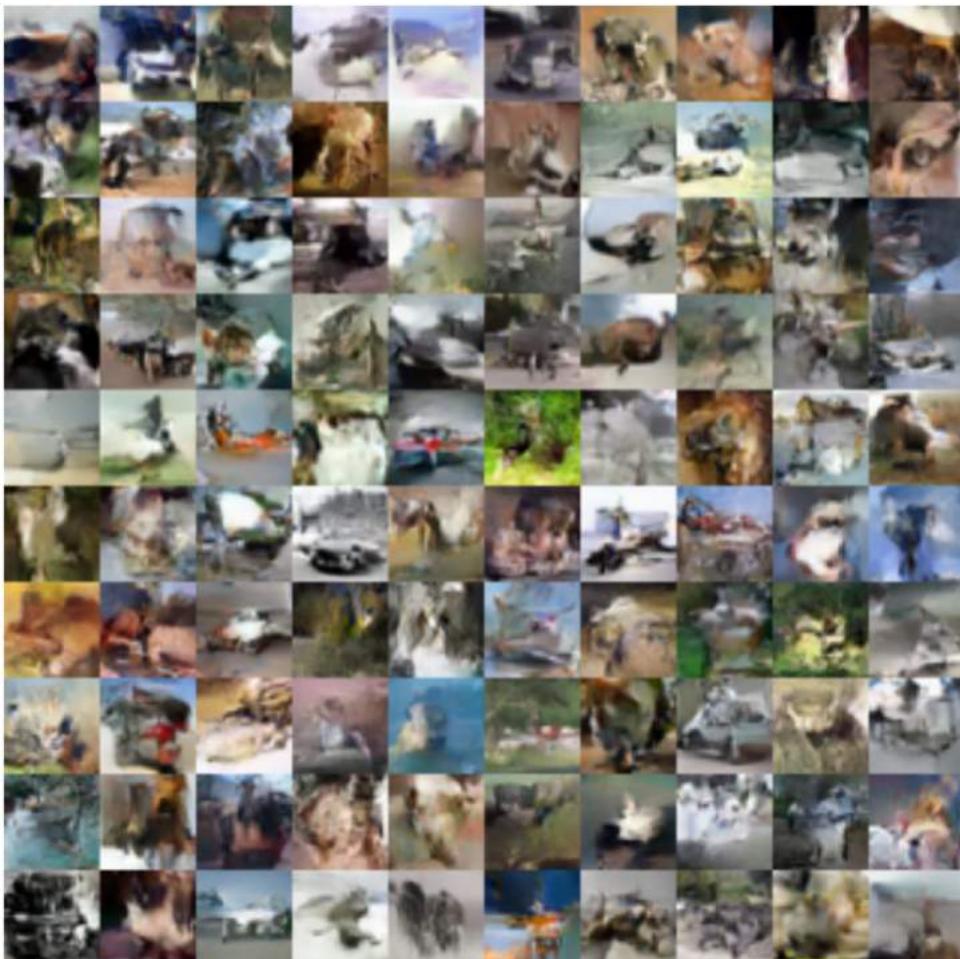

After training we can generate new data!

1. Sample z from prior $p(z)$
2. Run sampled z through decoder to get distribution over data x
3. Sample from distribution in (2) to generate data

Variational Autoencoders

After training we can **edit images**

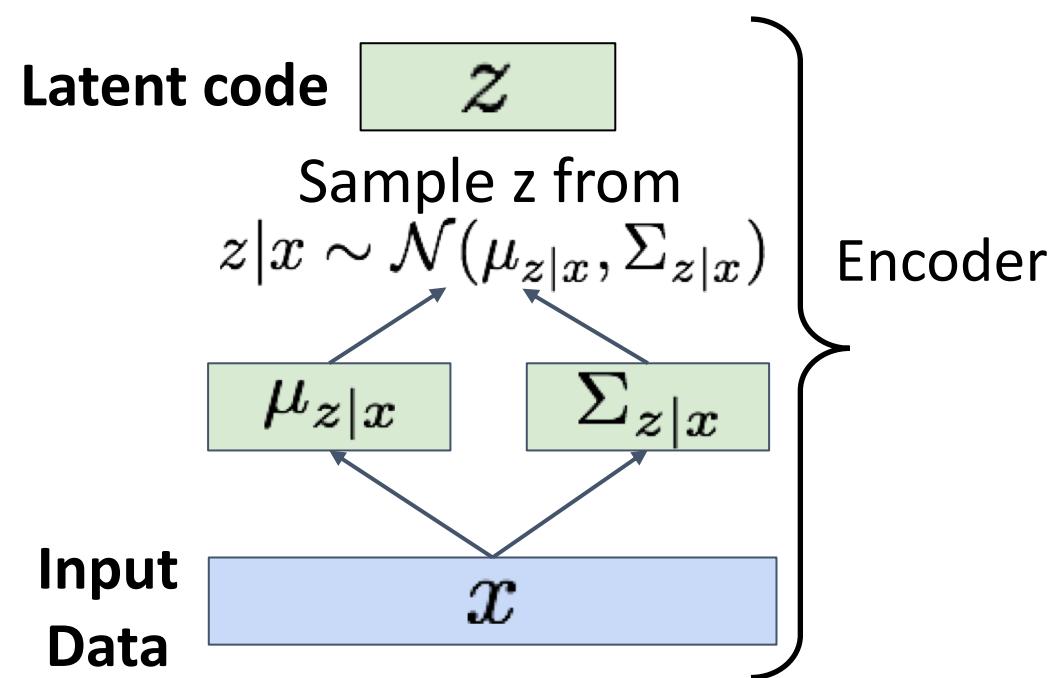

1. Run input data through **encoder** to get a distribution over latent codes

Variational Autoencoders

After training we can **edit images**

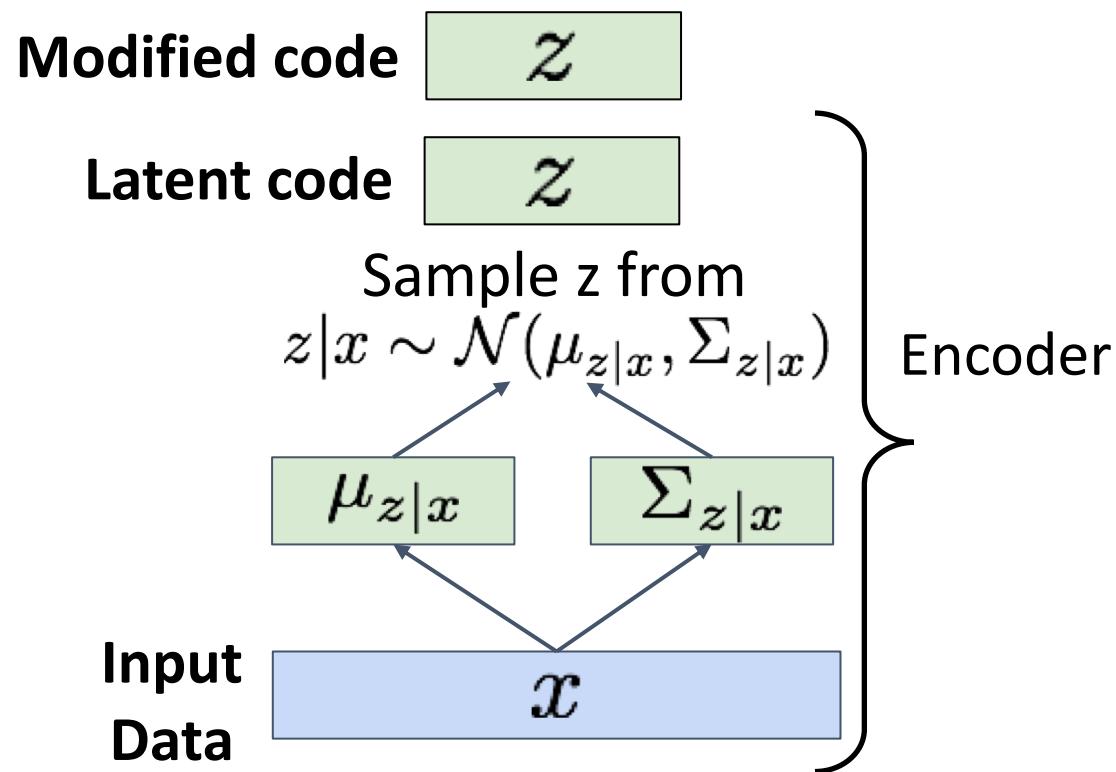

1. Run input data through **encoder** to get a distribution over latent codes
2. Sample code z from encoder output

Variational Autoencoders

After training we can **edit images**

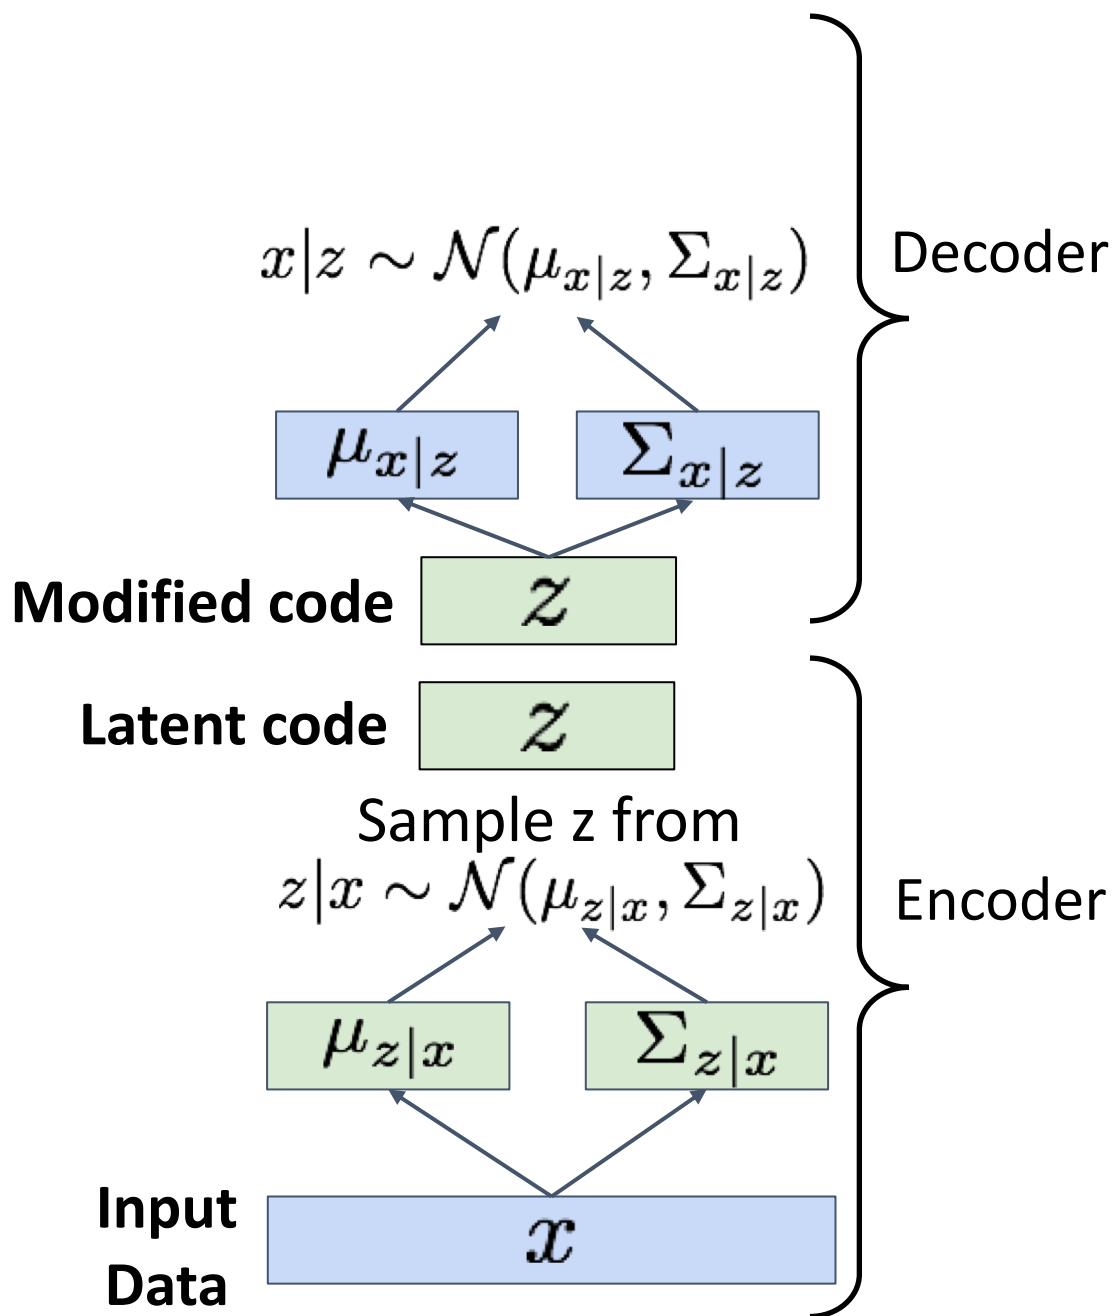

1. Run input data through **encoder** to get a distribution over latent codes
2. Sample code z from encoder output
3. Modify some dimensions of sampled code

Variational Autoencoders

After training we can **edit images**

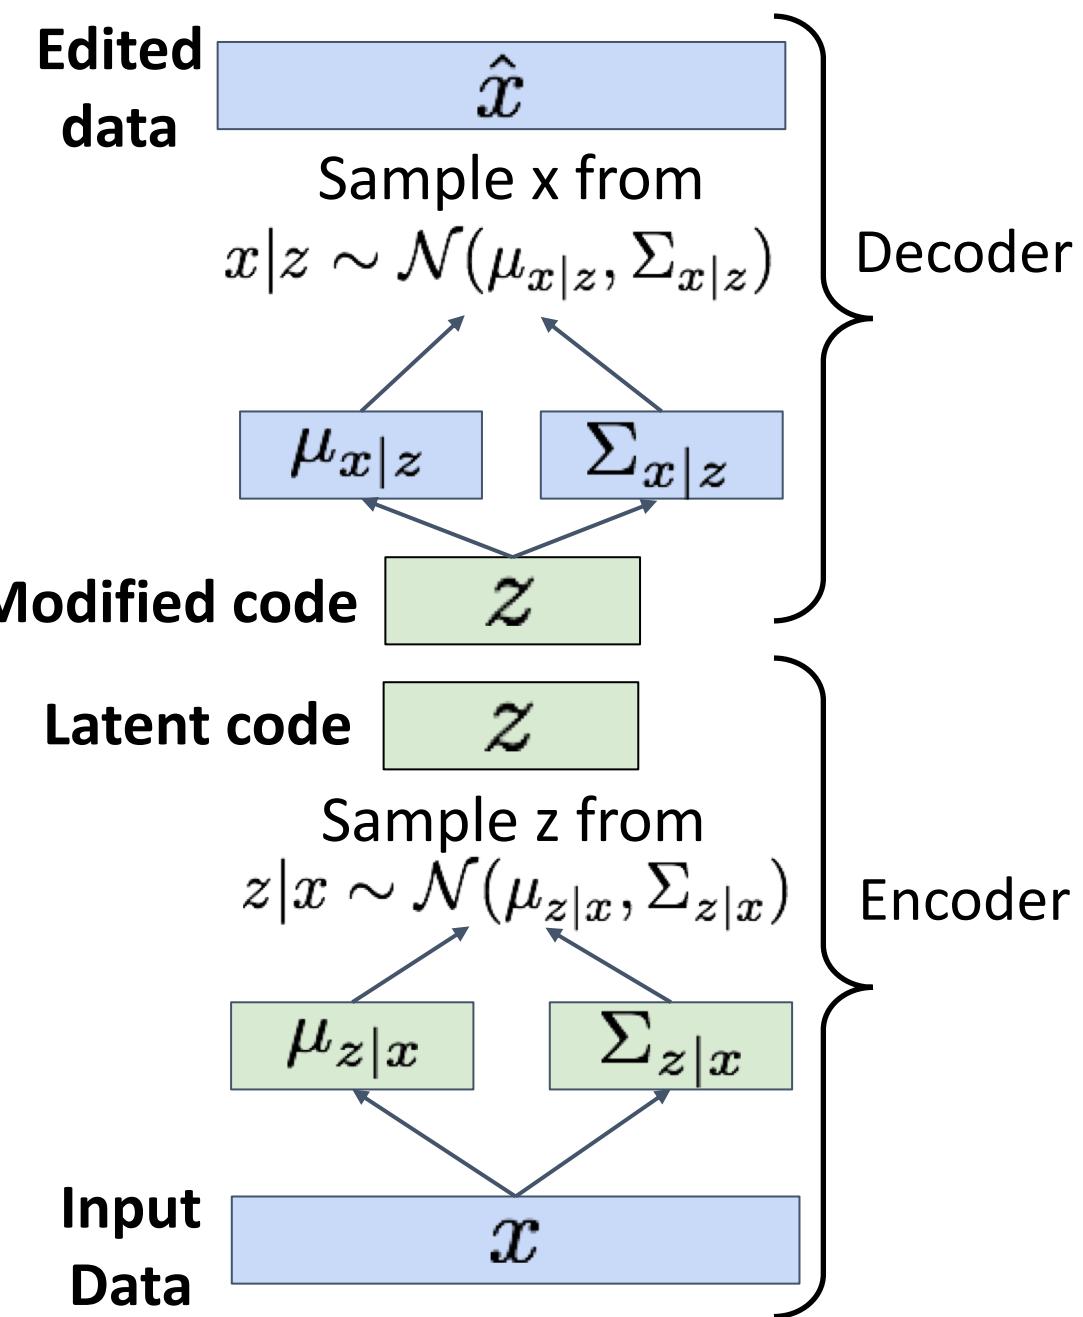

1. Run input data through **encoder** to get a distribution over latent codes
2. Sample code z from encoder output
3. Modify some dimensions of sampled code
4. Run modified z through **decoder** to get a distribution over data sample

Variational Autoencoders

Kulkarni et al, "Deep Convolutional Inverse Graphics Networks", NeurIPS 2014

Variational Autoencoder: Summary

Probabilistic spin to traditional autoencoders => allows generating data

Defines an intractable density => derive and optimize a (variational) lower bound

Pros:

- Principled approach to generative models
- Allows inference of $q(z|x)$, can be useful feature representation for other tasks

Cons:

- Maximizes lower bound of likelihood: okay, but not as good evaluation as PixelRNN/PixelCNN
- Samples blurrier and lower quality compared to state-of-the-art (GANs)

Active areas of research:

- More flexible approximations, e.g. richer approximate posterior instead of diagonal Gaussian, e.g., Gaussian Mixture Models (GMMs)
- Incorporating structure in latent variables, e.g., Categorical Distributions

So far: Two types of generative models

Autoregressive models

- Directly maximize $p(\text{data})$
- High-quality generated images
- Slow to generate images
- No explicit latent codes

Variational models

- Maximize lower-bound on $p(\text{data})$
- Generated images often blurry
- Very fast to generate images
- Learn rich latent codes

So far: Two types of generative models

Autoregressive models

- Directly maximize $p(\text{data})$
- High-quality generated images
- Slow to generate images
- No explicit latent codes

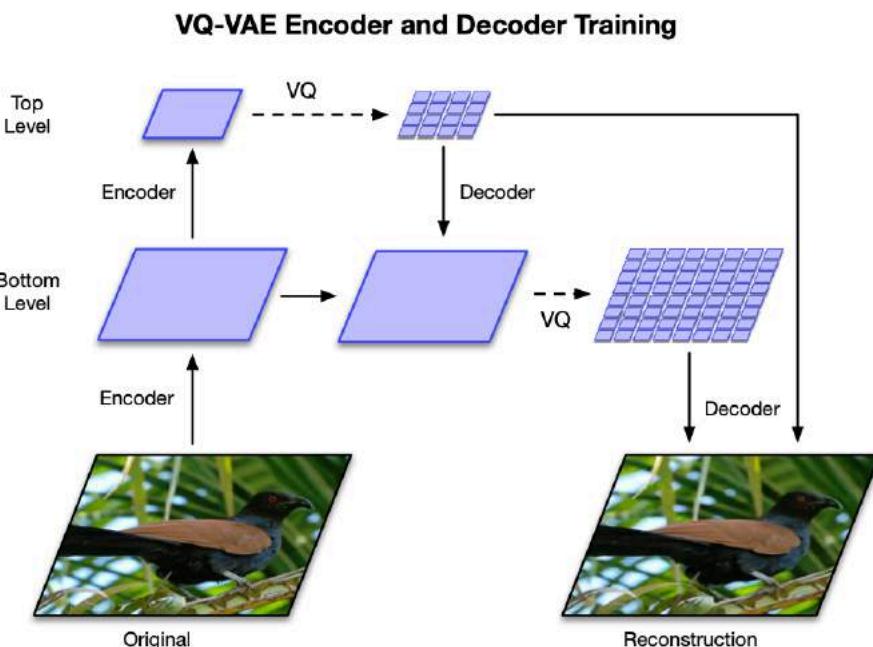

Variational models

- Maximize lower-bound on $p(\text{data})$
- Generated images often blurry
- Very fast to generate images
- Learn rich latent codes

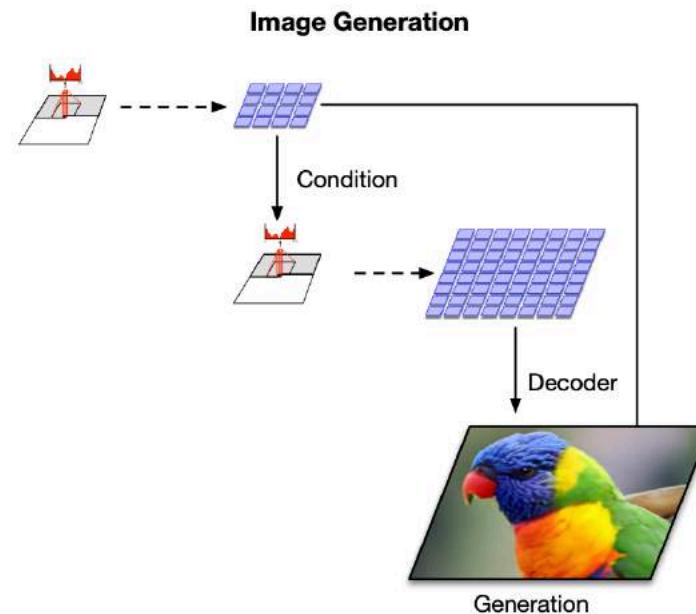

Can we combine them and get the best of both worlds?

Combining VAE + Autoregressive: Vector-Quantized Variational Autoencoder (VQ-VAE2)

Train a VAE-like model to generate multiscale grids of latent codes

Use a multiscale PixelCNN to sample in latent code space

Razavi et al, “Generating Diverse High-Fidelity Images with VQ-VAE-2”, NeurIPS 2019

Combining VAE + Autoregressive: VQ-VAE2

256 x 256 class-conditional samples, trained on ImageNet

Generative Models So Far:

Autoregressive Models directly maximize likelihood of training data:

$$p_{\theta}(x) = \prod_{i=1}^N p_{\theta}(x_i | x_1, \dots, x_{i-1})$$

Generative Models So Far:

Autoregressive Models directly maximize likelihood of training data:

$$p_{\theta}(x) = \prod_{i=1}^N p_{\theta}(x_i|x_1, \dots, x_{i-1})$$

Variational Autoencoders introduce a latent z , and maximize a lower bound:

$$p_{\theta}(x) = \int_Z p_{\theta}(x|z)p(z)dz \geq E_{z \sim q_{\phi}(z|x)}[\log p_{\theta}(x|z)] - D_{KL}\left(q_{\phi}(z|x), p(z)\right)$$

Generative Models So Far:

Autoregressive Models directly maximize likelihood of training data:

$$p_{\theta}(x) = \prod_{i=1}^N p_{\theta}(x_i|x_1, \dots, x_{i-1})$$

Variational Autoencoders introduce a latent z , and maximize a lower bound:

$$p_{\theta}(x) = \int_Z p_{\theta}(x|z)p(z)dz \geq E_{z \sim q_{\phi}(z|x)}[\log p_{\theta}(x|z)] - D_{KL}\left(q_{\phi}(z|x), p(z)\right)$$

Generative Adversarial Networks give up on modeling $p(x)$, but allow us to draw samples from $p(x)$

Generative Adversarial Networks

Setup: Assume we have data x_i drawn from distribution $p_{\text{data}}(x)$. Want to sample from p_{data} .

Generative Adversarial Networks

Setup: Assume we have data x_i drawn from distribution $p_{\text{data}}(x)$. Want to sample from p_{data} .

Idea: Introduce a latent variable z with simple prior $p(z)$.

Sample $z \sim p(z)$ and pass to a **Generator Network** $x = G(z)$

Then x is a sample from the **Generator distribution** p_G . Want $p_G = p_{\text{data}}$!

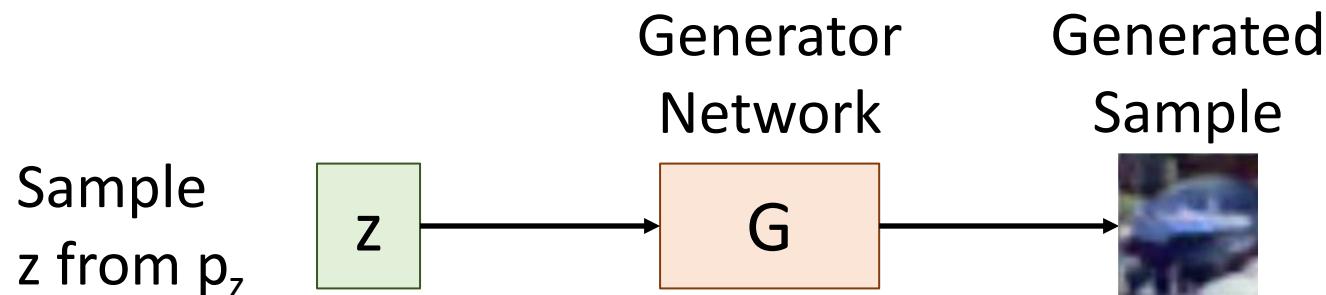

Generative Adversarial Networks

Setup: Assume we have data x_i drawn from distribution $p_{\text{data}}(x)$. Want to sample from p_{data} .

Idea: Introduce a latent variable z with simple prior $p(z)$.

Sample $z \sim p(z)$ and pass to a **Generator Network** $x = G(z)$

Then x is a sample from the **Generator distribution** p_G . Want $p_G = p_{\text{data}}$!

Train **Generator Network** G to convert
 z into fake data x sampled from p_G

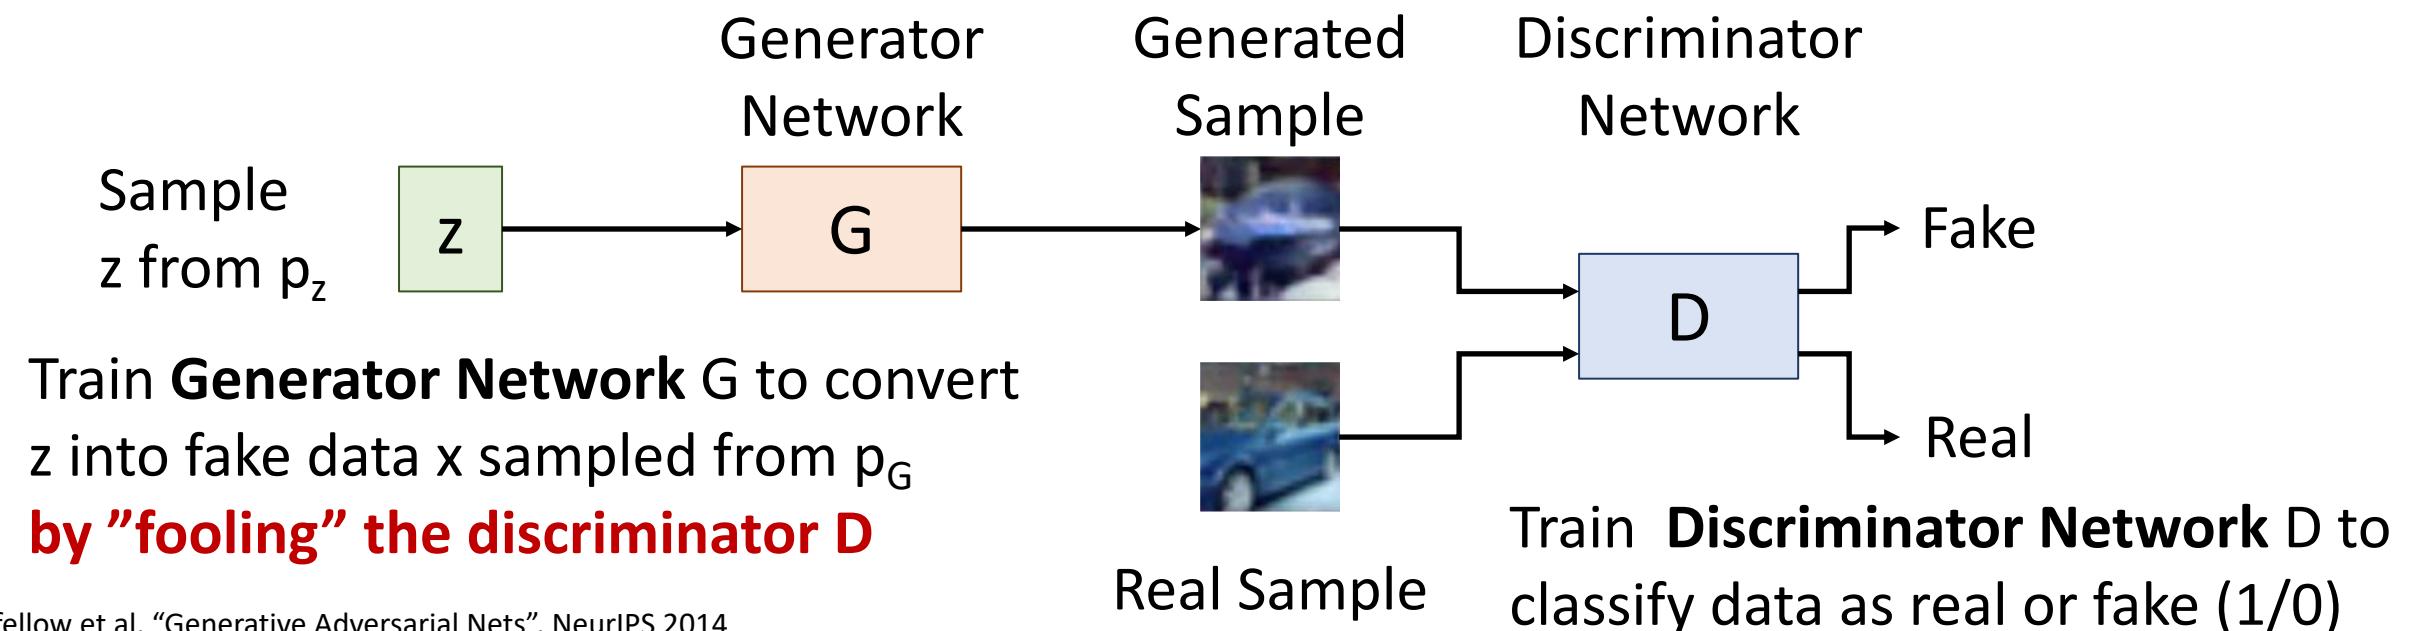

Generative Adversarial Networks

Setup: Assume we have data x_i drawn from distribution $p_{\text{data}}(x)$. Want to sample from p_{data} .

Idea: Introduce a latent variable z with simple prior $p(z)$.

Sample $z \sim p(z)$ and pass to a **Generator Network** $x = G(z)$

Then x is a sample from the **Generator distribution** p_G . Want $p_G = p_{\text{data}}$!

Generative Adversarial Networks

Idea: Introduce a latent variable z with simple prior $p(z)$.

Sample $z \sim p(z)$ and pass to a **Generator Network** $x = G(z)$

Then x is a sample from the **Generator distribution** p_G . Want $p_G = p_{\text{data}}$!

Jointly train **G** and **D**. Hopefully p_G converges to p_{data} !

Goodfellow et al, "Generative Adversarial Nets", NeurIPS 2014

Generative Adversarial Networks: Training Objective

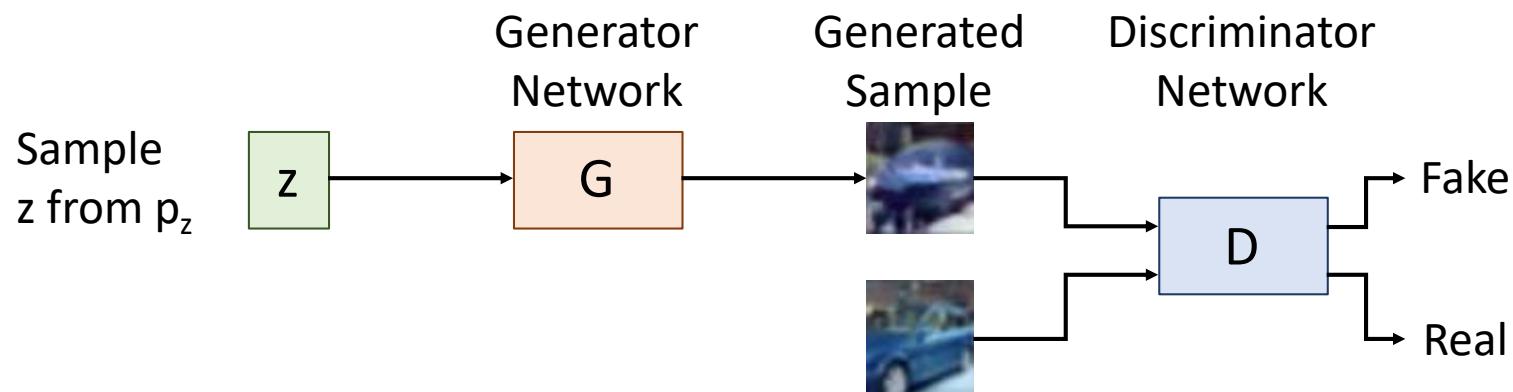

Jointly train generator G and discriminator D with a **minimax game**

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

Generative Adversarial Networks: Training Objective

Jointly train generator G and discriminator D with a **minimax game**

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

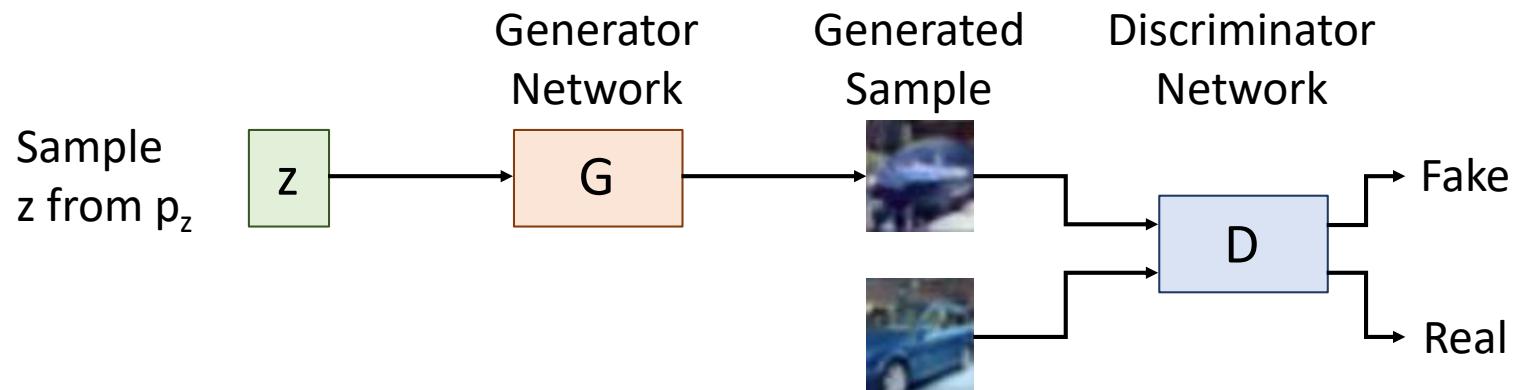

Goodfellow et al, "Generative Adversarial Nets", NeurIPS 2014

Generative Adversarial Networks: Training Objective

Jointly train generator G and discriminator D with a **minimax game**

Discriminator wants
 $D(x) = 1$ for real data

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

Goodfellow et al, "Generative Adversarial Nets", NeurIPS 2014

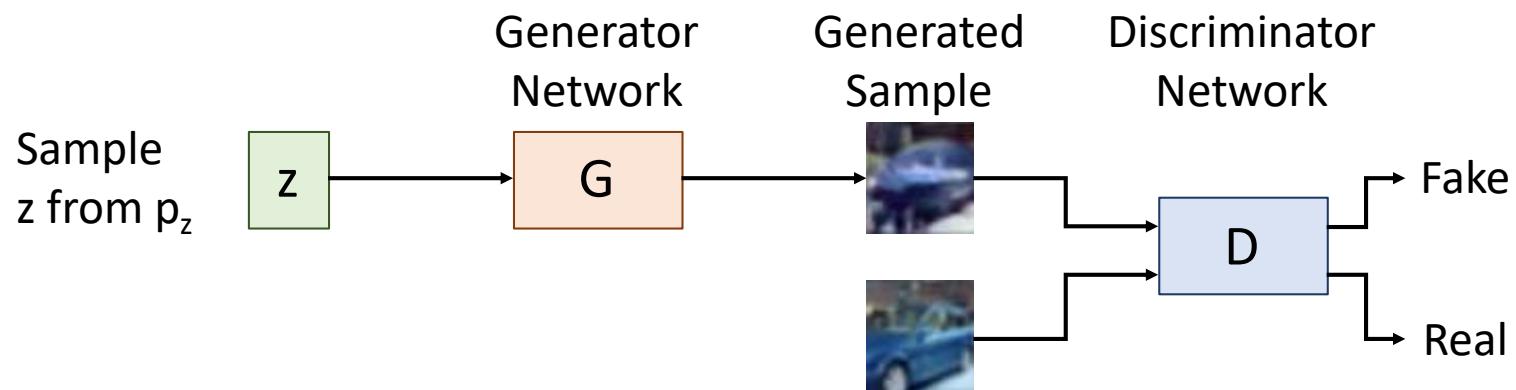

Generative Adversarial Networks: Training Objective

Jointly train generator G and discriminator D with a **minimax game**

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

**Discriminator wants
 $D(x) = 1$ for real data**

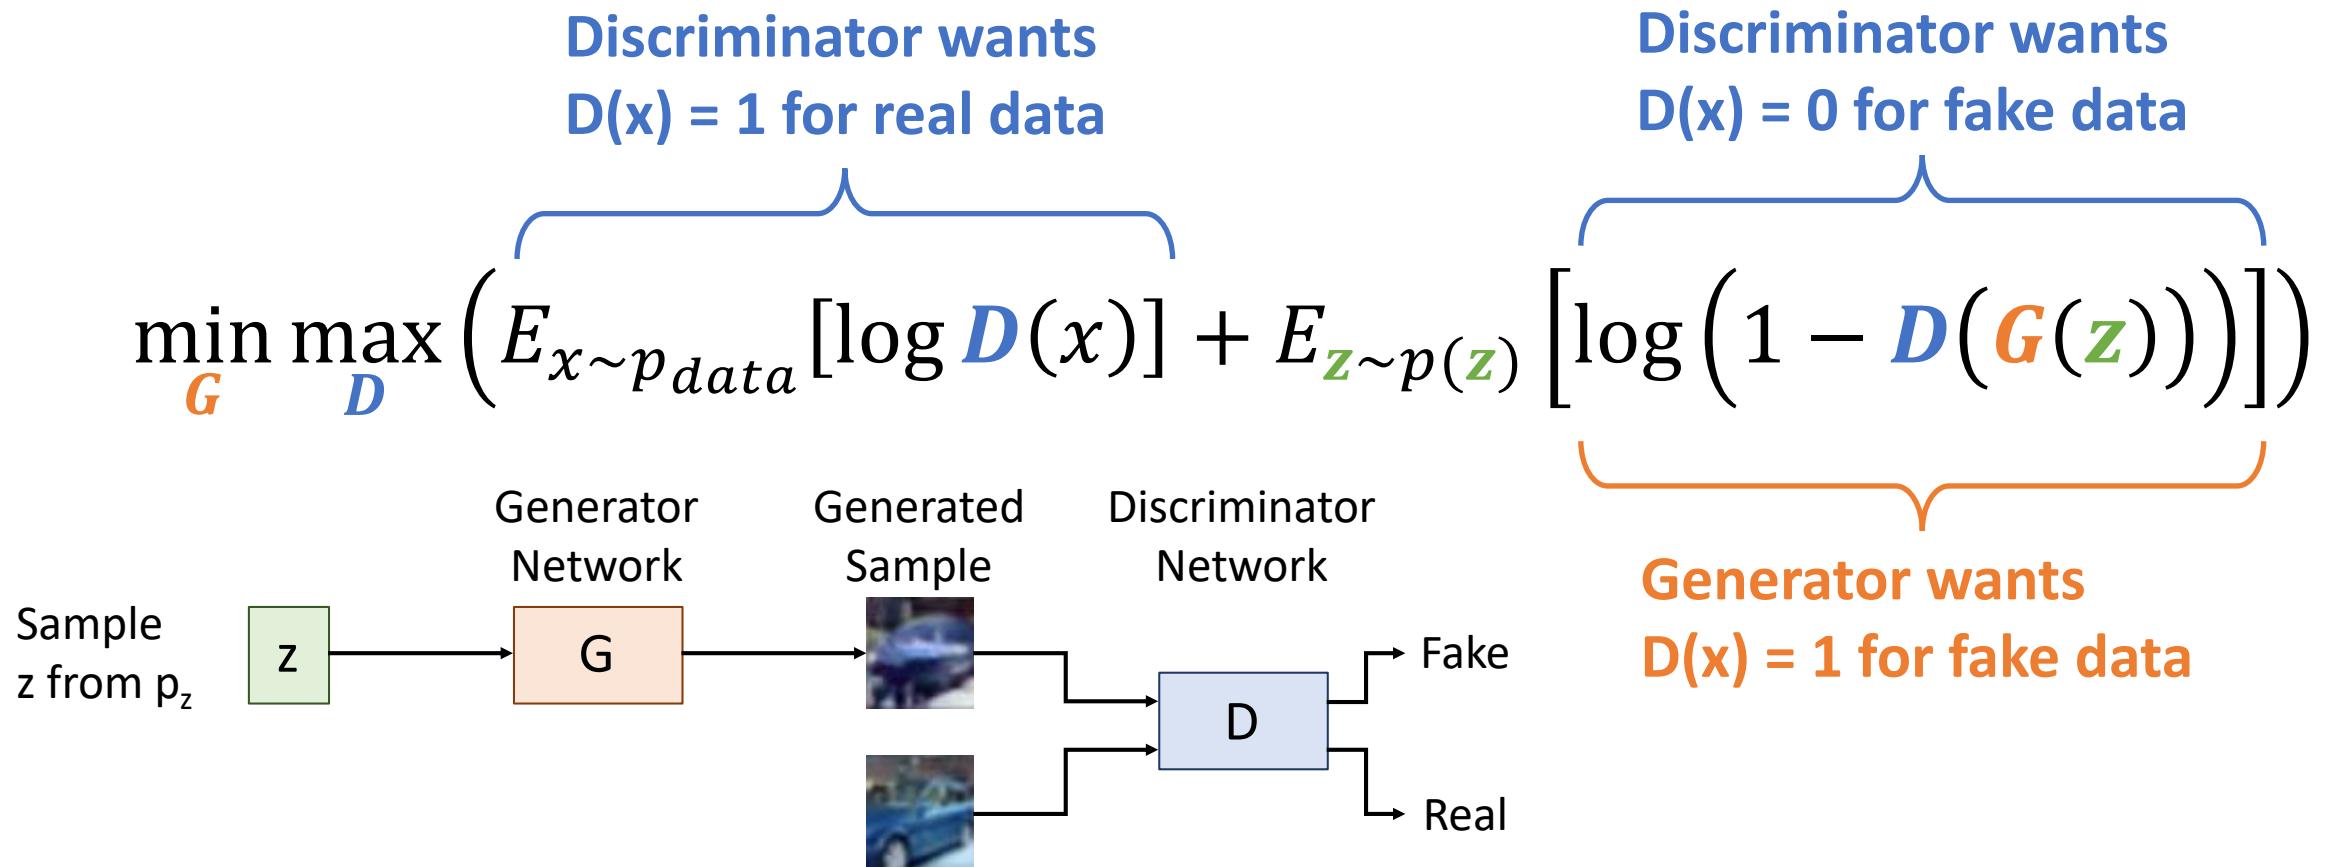

**Discriminator wants
 $D(x) = 0$ for fake data**

Goodfellow et al, "Generative Adversarial Nets", NeurIPS 2014

Generative Adversarial Networks: Training Objective

Jointly train generator G and discriminator D with a **minimax game**

Goodfellow et al, "Generative Adversarial Nets", NeurIPS 2014

Generative Adversarial Networks: Training Objective

Jointly train generator G and discriminator D with a **minimax game**

Train G and D using alternating gradient updates

$$\min_{\textcolor{brown}{G}} \max_{\textcolor{blue}{D}} \left(E_{x \sim p_{data}} [\log \textcolor{blue}{D}(x)] + E_{\textcolor{green}{z} \sim p(\textcolor{green}{z})} \left[\log \left(1 - \textcolor{blue}{D}(\textcolor{brown}{G}(\textcolor{green}{z})) \right) \right] \right)$$

Generative Adversarial Networks: Training Objective

Jointly train generator G and discriminator D with a **minimax game**

Train G and D using alternating gradient updates

$$\begin{aligned} & \min_{\textcolor{brown}{G}} \max_{\textcolor{blue}{D}} \left(E_{x \sim p_{data}} [\log \textcolor{blue}{D}(x)] + E_{\textcolor{green}{z} \sim p(\textcolor{green}{z})} \left[\log \left(1 - \textcolor{blue}{D}(\textcolor{brown}{G}(\textcolor{green}{z})) \right) \right] \right) \\ &= \min_{\textcolor{brown}{G}} \max_{\textcolor{blue}{D}} V(\textcolor{brown}{G}, \textcolor{blue}{D}) \end{aligned}$$

Generative Adversarial Networks: Training Objective

Jointly train generator G and discriminator D with a **minimax game**

Train G and D using alternating gradient updates

$$\begin{aligned} & \min_{\mathbf{G}} \max_{\mathbf{D}} \left(E_{x \sim p_{data}} [\log \mathbf{D}(x)] + E_{\mathbf{z} \sim p(\mathbf{z})} [\log (1 - \mathbf{D}(\mathbf{G}(\mathbf{z})))] \right) \\ &= \min_{\mathbf{G}} \max_{\mathbf{D}} V(\mathbf{G}, \mathbf{D}) \end{aligned}$$

For t in 1, ... T:

1. (Update \mathbf{D}) $\mathbf{D} = \mathbf{D} + \alpha_{\mathbf{D}} \frac{\partial V}{\partial \mathbf{D}}$
2. (Update \mathbf{G}) $\mathbf{G} = \mathbf{G} - \alpha_{\mathbf{G}} \frac{\partial V}{\partial \mathbf{G}}$

Generative Adversarial Networks: Training Objective

Jointly train generator G and discriminator D with a **minimax game**

Train G and D using alternating gradient updates

$$\begin{aligned} & \min_{\mathbf{G}} \max_{\mathbf{D}} \left(E_{x \sim p_{data}} [\log \mathbf{D}(x)] + E_{\mathbf{z} \sim p(\mathbf{z})} [\log (1 - \mathbf{D}(\mathbf{G}(\mathbf{z})))] \right) \\ &= \min_{\mathbf{G}} \max_{\mathbf{D}} V(\mathbf{G}, \mathbf{D}) \end{aligned}$$

We are not minimizing any overall loss! No training curves to look at!

For t in 1, ... T:

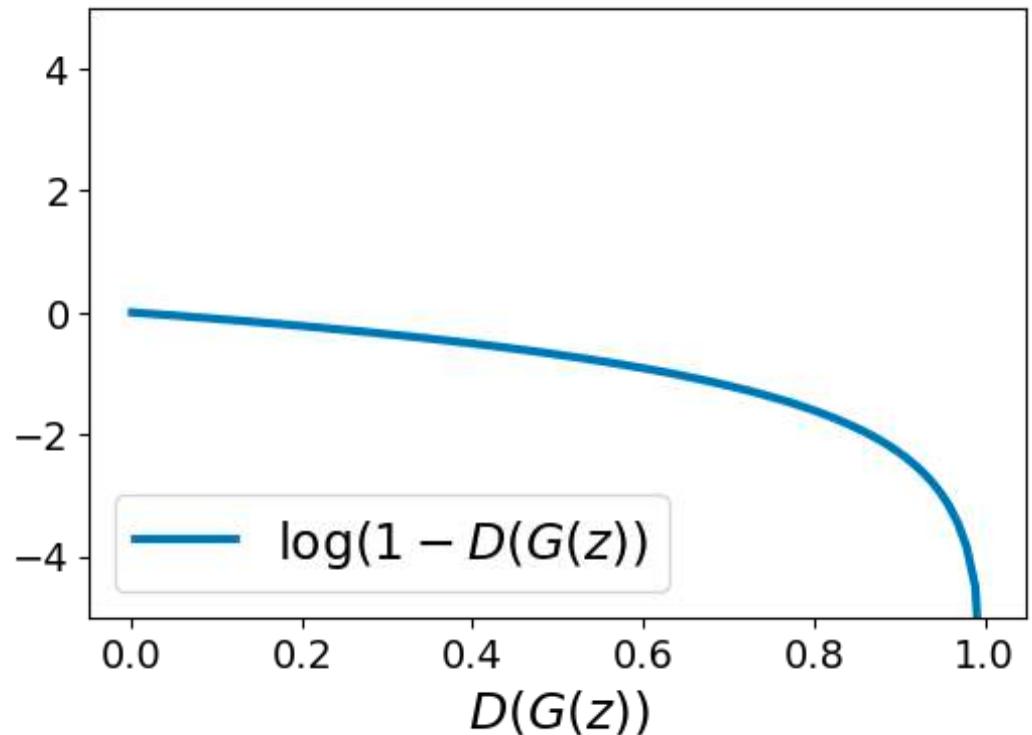

1. (Update D) $\mathbf{D} = \mathbf{D} + \alpha_{\mathbf{D}} \frac{\partial V}{\partial \mathbf{D}}$
2. (Update G) $\mathbf{G} = \mathbf{G} - \alpha_{\mathbf{G}} \frac{\partial V}{\partial \mathbf{G}}$

Generative Adversarial Networks: Training Objective

Jointly train generator G and discriminator D with a **minimax game**

$$\min_{\mathbf{G}} \max_{\mathbf{D}} \left(E_{x \sim p_{data}} [\log \mathbf{D}(x)] + E_{\mathbf{z} \sim p(\mathbf{z})} [\log (1 - \mathbf{D}(\mathbf{G}(\mathbf{z})))] \right)$$

At start of training, generator is very bad
and discriminator can easily tell apart
real/fake, so $D(G(z))$ close to 0

Goodfellow et al, "Generative Adversarial Nets", NeurIPS 2014

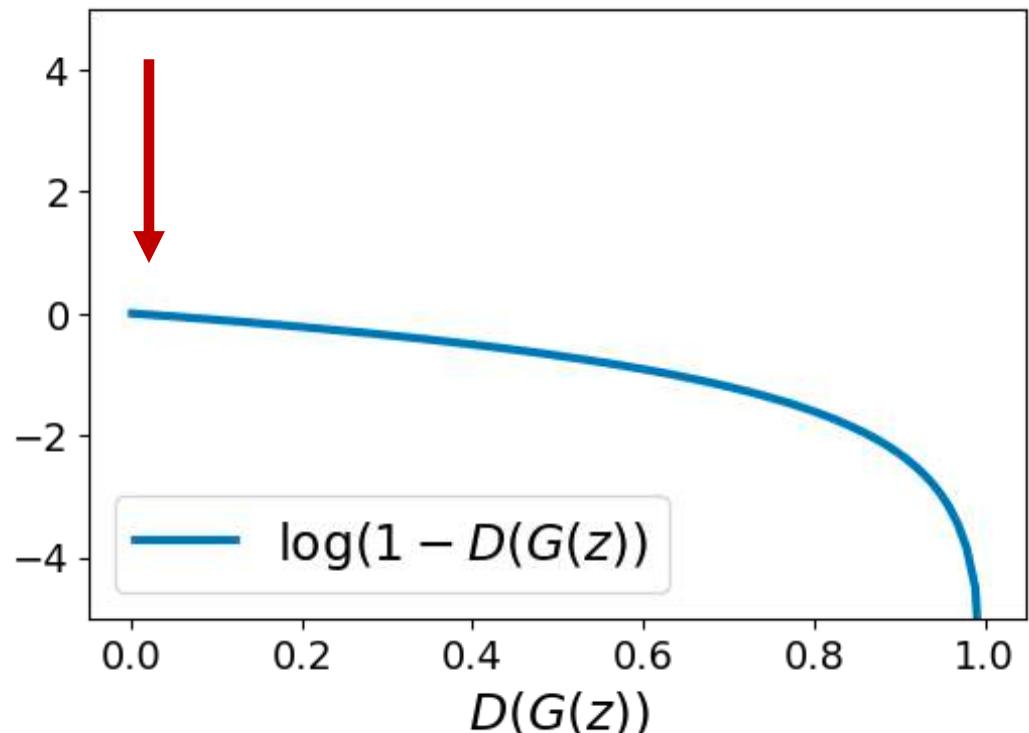

Generative Adversarial Networks: Training Objective

Jointly train generator G and discriminator D with a **minimax game**

$$\min_{\mathbf{G}} \max_{\mathbf{D}} \left(E_{x \sim p_{data}} [\log \mathbf{D}(x)] + E_{\mathbf{z} \sim p(\mathbf{z})} [\log (1 - \mathbf{D}(\mathbf{G}(\mathbf{z})))] \right)$$

At start of training, generator is very bad and discriminator can easily tell apart real/fake, so $D(G(z))$ close to 0

Problem: Vanishing gradients for G

Generative Adversarial Networks: Training Objective

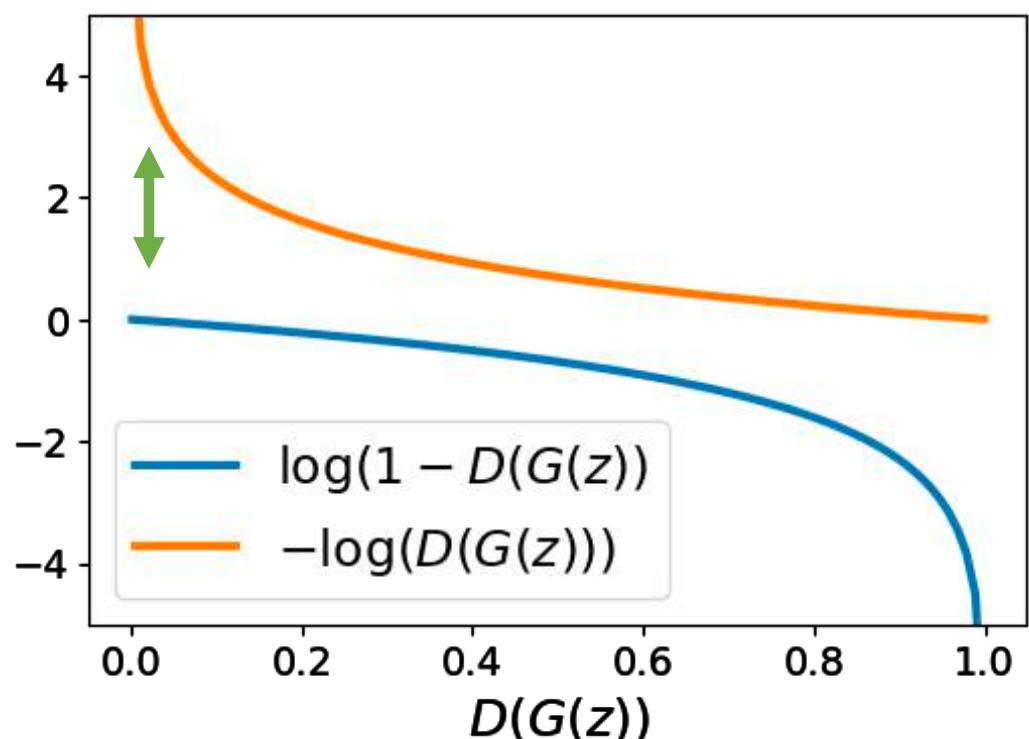

Jointly train generator G and discriminator D with a **minimax game**

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

At start of training, generator is very bad and discriminator can easily tell apart real/fake, so $D(G(z))$ close to 0

Problem: Vanishing gradients for G

Solution: Right now G is trained to minimize $\log(1 - D(G(z)))$. Instead, train G to maximize $-\log(D(G(z)))$. Then G gets strong gradients at start of training!

Goodfellow et al, "Generative Adversarial Nets", NeurIPS 2014

Generative Adversarial Networks: Optimality

Jointly train generator G and discriminator D with a **minimax game**

Why is this particular objective a good idea?

$$\min_{\textcolor{brown}{G}} \max_{\textcolor{blue}{D}} \left(E_{x \sim p_{data}} [\log \textcolor{blue}{D}(x)] + E_{\textcolor{green}{z} \sim p(\textcolor{green}{z})} \left[\log \left(1 - \textcolor{blue}{D}(\textcolor{brown}{G}(\textcolor{green}{z})) \right) \right] \right)$$

This minimax game achieves its global minimum when $p_G = p_{data}$!

Generative Adversarial Networks: Optimality

$$\min_{\textcolor{brown}{G}} \max_{\textcolor{blue}{D}} \left(E_{x \sim p_{data}} [\log \textcolor{blue}{D}(x)] + E_{\textcolor{green}{z} \sim p(\textcolor{green}{z})} [\log (1 - \textcolor{blue}{D}(\textcolor{brown}{G}(\textcolor{green}{z})))] \right)$$

(Our objective so far)

Generative Adversarial Networks: Optimality

$$\begin{aligned} & \min_{\textcolor{brown}{G}} \max_{\textcolor{blue}{D}} \left(E_{x \sim p_{data}} [\log \textcolor{blue}{D}(x)] + E_{\textcolor{green}{z} \sim p(\textcolor{green}{z})} \left[\log \left(1 - \textcolor{blue}{D}(\textcolor{brown}{G}(\textcolor{green}{z})) \right) \right] \right) \\ &= \min_{\textcolor{brown}{G}} \max_{\textcolor{blue}{D}} \left(E_{x \sim p_{data}} [\log \textcolor{blue}{D}(x)] + E_{x \sim p_{\textcolor{brown}{G}}} [\log (1 - \textcolor{blue}{D}(x))] \right) \end{aligned}$$

(Change of variables on second term)

Generative Adversarial Networks: Optimality

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

$$= \min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{x \sim p_G} [\log (1 - D(x))] \right)$$

$$= \min_G \max_D \int_X (p_{data}(x) \log D(x) + p_G(x) \log (1 - D(x))) dx$$

(Definition of expectation)

Generative Adversarial Networks: Optimality

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

$$= \min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{x \sim p_G} [\log (1 - D(x))] \right)$$

$$= \min_G \int_X \max_D (p_{data}(x) \log D(x) + p_G(x) \log (1 - D(x))) dx$$

(Push \max_D inside integral)

Generative Adversarial Networks: Optimality

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

$$= \min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{x \sim p_G} [\log (1 - D(x))] \right)$$

$$= \min_G \int_X \max_D (p_{data}(x) \log D(x) + p_G(x) \log (1 - D(x))) dx$$

$$f(y) = a \log y + b \log(1 - y)$$

(Side computation to compute max)

Generative Adversarial Networks: Optimality

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

$$= \min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{x \sim p_G} [\log (1 - D(x))] \right)$$

$$= \min_G \int_X \max_D (p_{data}(x) \log D(x) + p_G(x) \log (1 - D(x))) dx$$

$$f(y) = a \log y + b \log(1 - y)$$

$$f'(y) = \frac{a}{y} - \frac{b}{1 - y}$$

Generative Adversarial Networks: Optimality

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

$$= \min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{x \sim p_G} [\log (1 - D(x))] \right)$$

$$= \min_G \int_X \max_D (p_{data}(x) \log D(x) + p_G(x) \log (1 - D(x))) dx$$

$$f(y) = a \log y + b \log(1 - y) \quad f'(y) = 0 \iff y = \frac{a}{a+b} \text{ (local max)}$$

$$f'(y) = \frac{a}{y} - \frac{b}{1-y}$$

Generative Adversarial Networks: Optimality

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

$$= \min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{x \sim p_G} [\log (1 - D(x))] \right)$$

$$= \min_G \int_X \max_D (p_{data}(x) \log D(x) + p_G(x) \log (1 - D(x))) dx$$

$$f(y) = a \log y + b \log(1 - y) \quad f'(y) = 0 \iff y = \frac{a}{a+b} \text{ (local max)}$$

$$f'(y) = \frac{a}{y} - \frac{b}{1-y}$$

Optimal Discriminator: $D_G^*(x) = \frac{p_{data}(x)}{p_{data}(x) + p_G(x)}$

Jensen-Shannon Divergence:

$$JSD(\textcolor{red}{p}, \textcolor{violet}{q}) = \frac{1}{2} KL \left(\textcolor{red}{p}, \frac{\textcolor{red}{p} + \textcolor{violet}{q}}{2} \right) + \frac{1}{2} KL \left(\textcolor{violet}{q}, \frac{\textcolor{red}{p} + \textcolor{violet}{q}}{2} \right)$$

Generative Adversarial Networks: Optimality

$$\min_{\textcolor{brown}{G}} \max_{\textcolor{blue}{D}} \left(E_{x \sim p_{data}} [\log \textcolor{blue}{D}(x)] + E_{\textcolor{green}{z} \sim p(\textcolor{green}{z})} [\log (1 - \textcolor{blue}{D}(\textcolor{brown}{G}(\textcolor{green}{z})))] \right)$$

$$= \min_{\textcolor{brown}{G}} \left(E_{x \sim p_{data}} \left[\log \frac{2 * p_{data}(x)}{p_{data}(x) + p_{\textcolor{brown}{G}}(x)} \right] + E_{x \sim p_{\textcolor{brown}{G}}} \left[\log \frac{2 * p_{\textcolor{brown}{G}}(x)}{p_{data}(x) + p_{\textcolor{brown}{G}}(x)} \right] - \log 4 \right)$$

$$= \min_{\textcolor{brown}{G}} \left(KL \left(p_{data}, \frac{p_{data} + p_{\textcolor{violet}{G}}}{2} \right) + KL \left(p_{\textcolor{violet}{G}}, \frac{p_{data} + p_{\textcolor{violet}{G}}}{2} \right) - \log 4 \right)$$

Jensen-Shannon Divergence:

$$JSD(\textcolor{red}{p}, \textcolor{violet}{q}) = \frac{1}{2} KL \left(\textcolor{red}{p}, \frac{\textcolor{red}{p} + \textcolor{violet}{q}}{2} \right) + \frac{1}{2} KL \left(\textcolor{violet}{q}, \frac{\textcolor{red}{p} + \textcolor{violet}{q}}{2} \right)$$

Generative Adversarial Networks: Optimality

$$\min_{\textcolor{brown}{G}} \max_{\textcolor{blue}{D}} \left(E_{x \sim p_{data}} [\log \textcolor{blue}{D}(x)] + E_{\textcolor{green}{z} \sim p(\textcolor{green}{z})} [\log (1 - \textcolor{blue}{D}(\textcolor{brown}{G}(\textcolor{green}{z})))] \right)$$

$$= \min_{\textcolor{brown}{G}} \left(E_{x \sim p_{data}} \left[\log \frac{2 * p_{data}(x)}{p_{data}(x) + p_{\textcolor{brown}{G}}(x)} \right] + E_{x \sim p_{\textcolor{brown}{G}}} \left[\log \frac{2 * p_{\textcolor{brown}{G}}(x)}{p_{data}(x) + p_{\textcolor{brown}{G}}(x)} \right] - \log 4 \right)$$

$$= \min_{\textcolor{brown}{G}} \left(KL \left(p_{data}, \frac{p_{data} + p_{\textcolor{violet}{G}}}{2} \right) + KL \left(p_{\textcolor{violet}{G}}, \frac{p_{data} + p_{\textcolor{violet}{G}}}{2} \right) - \log 4 \right)$$

$$= \min_{\textcolor{brown}{G}} (2 * JSD(p_{data}, p_{\textcolor{violet}{G}}) - \log 4)$$

Jensen-Shannon Divergence:

$$JSD(\textcolor{red}{p}, \textcolor{violet}{q}) = \frac{1}{2} KL \left(\textcolor{red}{p}, \frac{\textcolor{red}{p} + \textcolor{violet}{q}}{2} \right) + \frac{1}{2} KL \left(\textcolor{violet}{q}, \frac{\textcolor{red}{p} + \textcolor{violet}{q}}{2} \right)$$

Generative Adversarial Networks: Optimality

$$\min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right)$$

$$= \min_G \left(E_{x \sim p_{data}} \left[\log \frac{2 * p_{data}(x)}{p_{data}(x) + p_G(x)} \right] + E_{x \sim p_G} \left[\log \frac{2 * p_G(x)}{p_{data}(x) + p_G(x)} \right] - \log 4 \right)$$

$$= \min_G \left(KL \left(p_{data}, \frac{p_{data} + p_G}{2} \right) + KL \left(p_G, \frac{p_{data} + p_G}{2} \right) - \log 4 \right)$$

$$= \min_G (2 * JSD(p_{data}, p_G) - \log 4)$$

JSD is always nonnegative, and zero only
when the two distributions are equal!
Thus $p_{data} = p_G$ is the global min, QED

Jensen-Shannon Divergence:

$$JSD(p, q) = \frac{1}{2} KL \left(p, \frac{p + q}{2} \right) + \frac{1}{2} KL \left(q, \frac{p + q}{2} \right)$$

Generative Adversarial Networks: Optimality

$$\begin{aligned} & \min_{\textcolor{brown}{G}} \max_{\textcolor{blue}{D}} \left(E_{x \sim p_{data}} [\log \textcolor{blue}{D}(x)] + E_{\textcolor{green}{z} \sim p(\textcolor{green}{z})} \left[\log \left(1 - \textcolor{blue}{D}(\textcolor{brown}{G}(\textcolor{green}{z})) \right) \right] \right) \\ &= \min_{\textcolor{brown}{G}} (2 * JSD(p_{data}, p_{\textcolor{brown}{G}}) - \log 4) \end{aligned}$$

Generative Adversarial Networks: Optimality

$$\begin{aligned} & \min_{\mathcal{G}} \max_{\mathcal{D}} \left(E_{x \sim p_{data}} [\log \mathcal{D}(x)] + E_{z \sim p(z)} [\log (1 - \mathcal{D}(\mathcal{G}(z)))] \right) \\ &= \min_{\mathcal{G}} (2 * JSD(p_{data}, p_{\mathcal{G}}) - \log 4) \end{aligned}$$

Summary: The global minimum of the minimax game happens when:

1. $D_G^*(x) = \frac{p_{data}(x)}{p_{data}(x) + p_G(x)}$ (Optimal discriminator for any G)
2. $p_G(x) = p_{data}(x)$ (Optimal generator for optimal D)

Generative Adversarial Networks: Optimality

$$\begin{aligned} & \min_G \max_D \left(E_{x \sim p_{data}} [\log D(x)] + E_{z \sim p(z)} [\log (1 - D(G(z)))] \right) \\ &= \min_G (2 * JSD(p_{data}, p_G) - \log 4) \end{aligned}$$

Summary: The global minimum of the minimax game happens when:

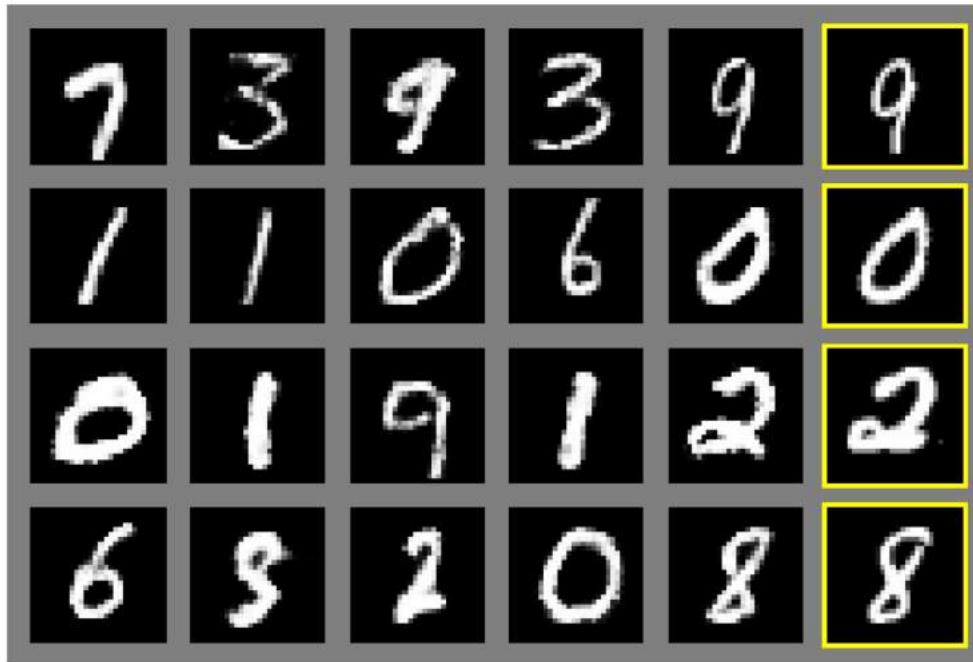

1. $D_G^*(x) = \frac{p_{data}(x)}{p_{data}(x) + p_G(x)}$ (Optimal discriminator for any G)
2. $p_G(x) = p_{data}(x)$ (Optimal generator for optimal D)

Caveats:

1. G and D are neural nets with fixed architecture. We don't know whether they can actually represent the optimal D and G.
2. This tells us nothing about convergence to the optimal solution

Conditional GANs

Recall: Conditional Generative Models learn $p(x|y)$ instead of $p(x)$

Make generator and discriminator both take label y as an additional input!

Conditional GANs: Conditional Batch Normalization

Batch Normalization

$$\mu_j = \frac{1}{N} \sum_{i=1}^N x_{i,j}$$

$$\sigma_j^2 = \frac{1}{N} \sum_{i=1}^N (x_{i,j} - \mu_j)^2$$

$$\hat{x}_{i,j} = \frac{x_{i,j} - \mu_j}{\sqrt{\sigma_j^2 + \epsilon}}$$

$$y_{i,j} = \gamma_j \hat{x}_{i,j} + \beta_j$$

Learn a separate scale and shift for each different label y

Conditional Batch Normalization

$$\mu_j = \frac{1}{N} \sum_{i=1}^N x_{i,j}$$

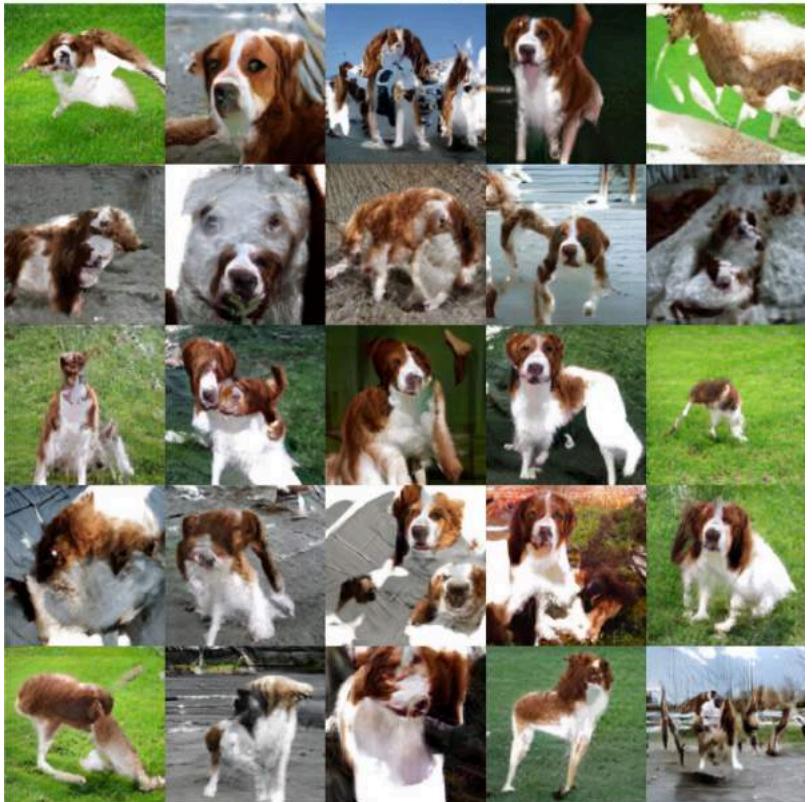

$$\sigma_j^2 = \frac{1}{N} \sum_{i=1}^N (x_{i,j} - \mu_j)^2$$

$$\hat{x}_{i,j} = \frac{x_{i,j} - \mu_j}{\sqrt{\sigma_j^2 + \epsilon}}$$

$$y_{i,j} = \gamma_j^y \hat{x}_{i,j} + \beta_j^y$$

GANs: Not just for images! Trajectory Prediction

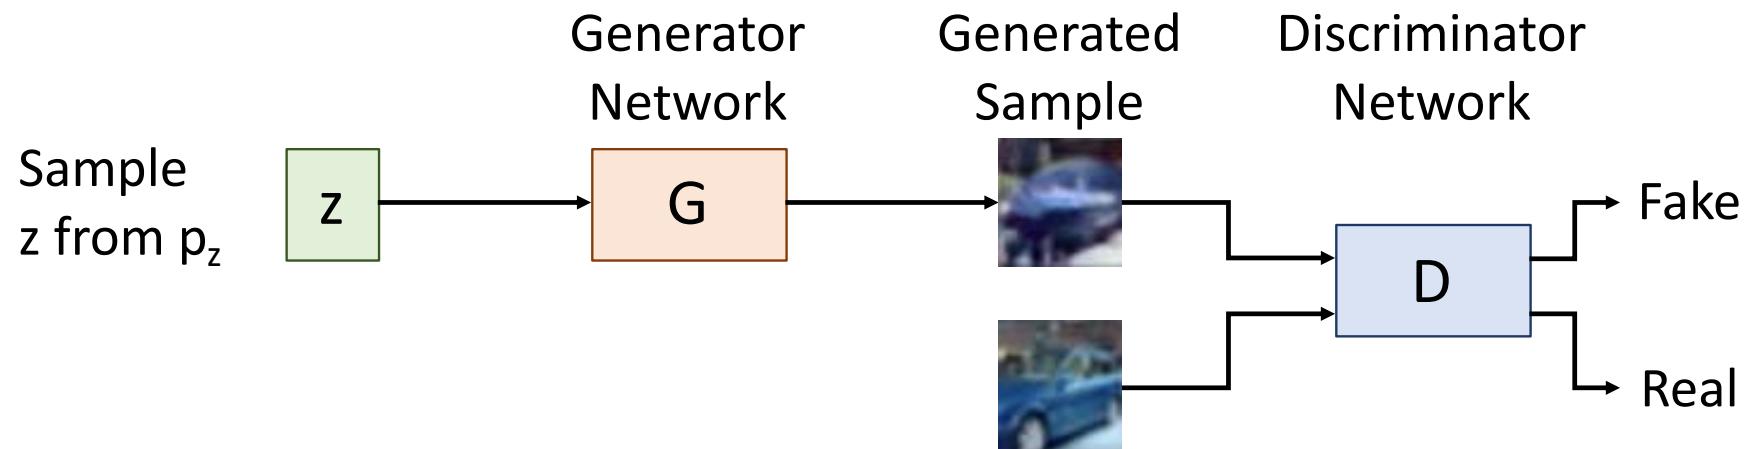

Gupta, Johnson, Li, Savarese, Alahi, "Social GAN: Socially Acceptable Trajectories with Generative Adversarial Networks", CVPR 2018

GAN Summary

Jointly train two networks:

Discriminator: Classify data as real or fake

Generator: Generate data that fools the discriminator

Under some assumptions, generator converges to true data distribution
Many applications! Very active area of research!

Taxonomy of Generative Models

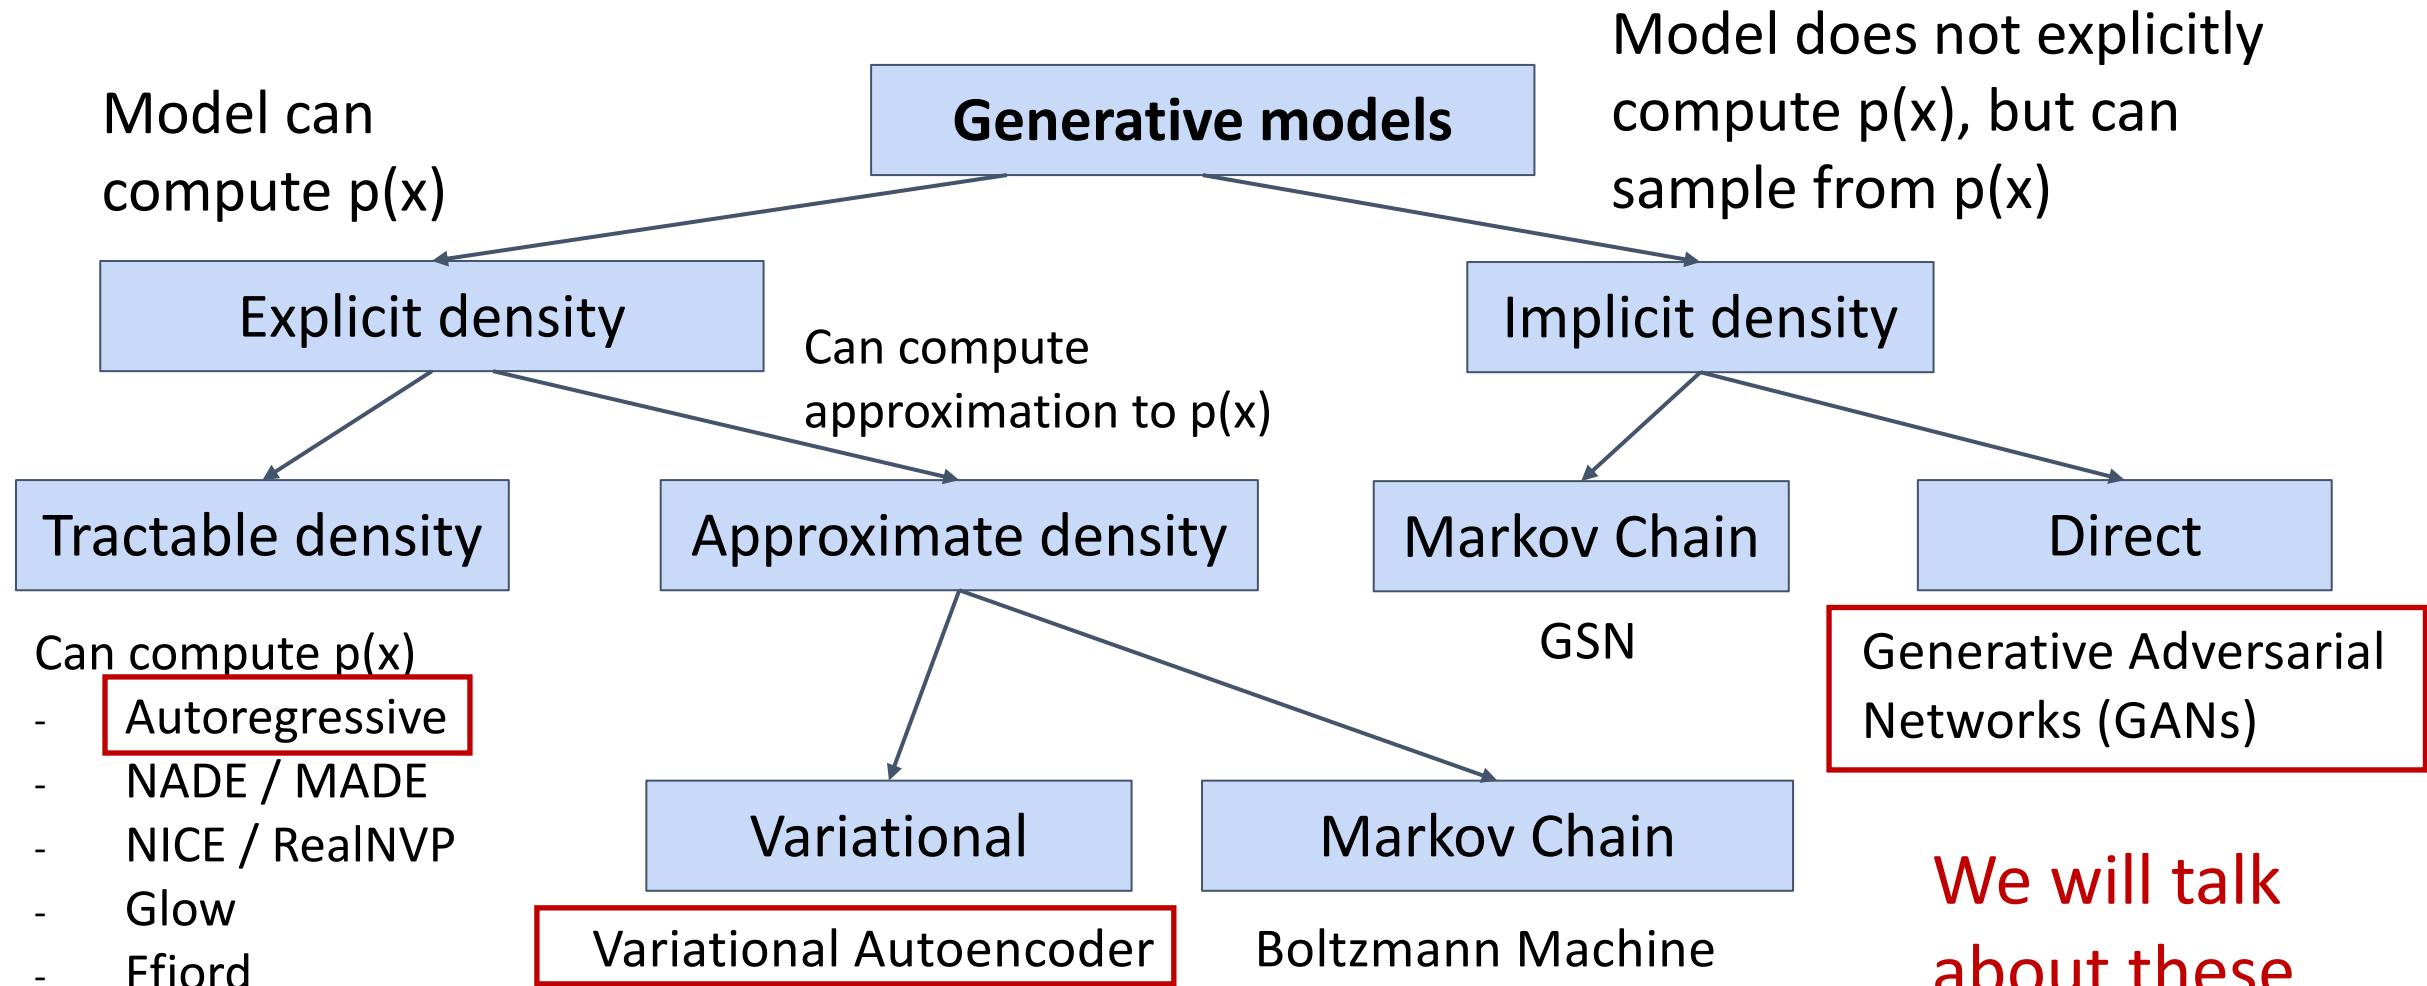

Figure adapted from Ian Goodfellow, Tutorial on Generative Adversarial Networks, 2017.

Generative Models Summary

Autoregressive Models directly maximize likelihood of training data:

$$p_{\theta}(x) = \prod_{i=1}^N p_{\theta}(x_i|x_1, \dots, x_{i-1})$$

Good image quality, can evaluate with perplexity. Slow to generate data, needs tricks to scale up.

Variational Autoencoders introduce a latent z , and maximize a lower bound:

$$p_{\theta}(x) = \int_Z p_{\theta}(x|z)p(z)dz \geq E_{z \sim q_{\phi}(z|x)}[\log p_{\theta}(x|z)] - D_{KL}\left(q_{\phi}(z|x), p(z)\right)$$

Latent z allows for powerful interpolation and editing applications.

Generative Adversarial Networks give up on modeling $p(x)$, but allow us to draw samples from $p(x)$. Difficult to evaluate, but best qualitative results today
